This is the USC Listproc archive of AAPORNET messages for this entire month. It is one big message, in chronological order, just the way the USC archive stored it. You can search within this month with your browser's search function (usually Ctrl-F).

Turning this into individual messages that ASU's Listserv software can index and sort means a lot of reformatting. We will do this as time permits.

New messages are of course automatically formatted and indexed correctly, and I have converted November 1994 through January 1995 and June 2002 to the present.

I have a client at the Minnesota Department of Economic Security, Vocational Services Branch, who is interested in finding out about vocational rehabilitation needs assessments that have been conducted or are in the planning stages. If you know of anyone conducting such surveys, please reply directly to him at steve.scholl@state.mn.us or call him at (651) 296-5642. Thanks for any help you can provide.

I am developing a survey on gambling opinions and behavior. I'm thinking about asking a question or two that try to get at an individual's knowledge of the rules of probability or of relative risk. Does anyone have examples of such questions? I'd appreciate any suggestions.

You can try contacting Dr. Thomas Wallsten, a decision theorist, at the University of North Carolina at Chapel Hill. He has done research on decision theory as it relates to gambling.

Generally UNC's email addresses use first name underscore last name at unc.edu.

There is a whole literature on the perception of risk from Amos Tversky and Daniel Kahneman. It may not be quite what you have in mind, but you might find it useful to take a look anyway.

Jan Werner

Perhaps not directly related, FYI: There is at least one book on the cultural history of gaming in the American Indian community, might be good background if you plan to interview members of that group (have it and can dig it up if you need reference). Mark Richards

The New England Chapter of AAPOR is sponsoring a mid-year meeting next week. All are invited.

Our guest will be Rich Morin, Director of Polling and Staff Writer of the Washington Post (and AAPOR/WAPOR member). Rich will be leading an informal discussion of his work. To see some examples, check out the Poll Vault section at the Post website.

The details:
Wednesday, December 8, 1999
6-8 pm
Taubman 275
John F. Kennedy School of Government
Eliot Street, Cambridge (next to the Charles Hotel Plaza)

The best bet for parking is the Eliot Street garage on the corner of Eliot and JFK Streets.

Light supper (sandwiches, salads) will be served at 6 pm and the discussion will begin at 6:30.

PLEASE CONFIRM YOUR ATTENDANCE BY REPLYING TO
kdonelan@hsph.harvard.edu (and not to the list)

RESERVATIONS ARE NEEDED BY 12/3/99.

Price for NEAAPOR members: $10
Start by asking Paul Slovic, who is at U Oregon (Psychology, I think) and also with Decision Research in Oregon. He has done a lot of work on risk. A lot of interesting and nonobvious stuff is in this field.

Also try Ronald Pavalko, who recently retired from U Wisconsin Parkside in Sociology. Ron published a book late last year on gambling.
Gallup has done a variety of surveys on gambling attitudes and behavior.

I work on how people pick lottery numbers and playing the lottery--so please forward to me whatever else you find out!

Dare I say: good luck?

Best regards,
Susan

Subject: Globalization and the Wage Gap
Andy Kohut has done it again, this time with a most interesting piece on the OpEd page of the NY Times re the meaning of the recent protests at the WTO meeting in Seattle.

http://www.nytimes.com/yr/mo/day/oped/03kohu.html
Clearly the worst of what we have seen in Seattle is thuggery for its own sake, but the support for the broader peaceful protest and the backing from unions and well-established special-interest groups show that there are pockets of deep disquiet amid the general contentment.
Globalization and the Wage Gap

By ANDREW KOHUT

December 3, 1999
ASHINGTON -- It's difficult to decide how seriously to take the protests in Seattle against the World Trade Organization. We learned in the 1960's that unruly people taking to the streets can foreshadow broader changes in public opinion. Yet these protests are mostly about economics, and we also know that Americans are more financially satisfied than they have been in years and that consumer confidence is near record levels.

Clearly the worst of what we have seen in Seattle is thuggery for its own sake, but the support for the broader peaceful protest and the backing from unions and well-established special-interest groups show that there are pockets of deep disquiet amid the general contentment.

Americans do not speak with one voice about globalization, and while most people are enjoying the boom years, it is a very top-heavy celebration.
In a Pew Research Center nationwide survey in April, 43 percent of respondents said that in the future a global economy would help average Americans, while 52 percent said it would hurt them. But these overall results mask a yawning gap.

Among Americans in families earning $75,000 or more, 63 percent see globalization as positive. That falls to 48 percent for those with household income of $50,000 to $74,999. And among the half of American adults in families earning less than $50,000, the positive view of globalism is held by just 37 percent.

Surveys in 1998 by Pew and Gallup found small pluralities favoring globalization overall, but both polls also showed the same strong socioeconomic skew.

Pew surveys of long-term trends, updated each year, have found that on average, Americans rate their financial situation better now than they did from 1994 through 1996. But financial satisfaction is significantly higher only among people with family incomes of $50,000 and higher. Those in lower-earning families rated their situation no better this year than they did in 1994. The
improvement they have reported is a decrease in financial pressure: fewer said this year that they "often did not have enough money to make ends meet" than did so in 1994.

<p>Wages continue to be a source of concern. Just 39 percent of Americans say they earn enough money to lead the life they want. There has been a significant decline in satisfaction with wages among those earning less than $50,000: only 27 percent now say they earn enough, down from 33 percent in 1994. According to a nationwide survey in October by The Washington Post, 67 percent of Americans worry that good jobs will move overseas and that workers will be left with jobs that don't pay enough.</p>

<p>Until this week, Americans had not heard much about the W.T.O. The public continues to be of two minds about free trade, however, generally supporting the concept but expressing criticism of specific policies and agreements. The North American Free Trade Agreement gets, at best, a mixed review, and there is still little support for giving the president increased authority to negotiate
Americans' concern about trade agreements does not appear to be rooted in a general worry about the loss of American sovereignty: surveys show their concerns are more specific. We found strong public backing for internationally mandated environmental standards, for example, which weaken nations' sovereign powers, in the same surveys in which Nafta, which also weakens sovereignty, received significant opposition. Broad opposition to the W.T.O. could develop around specific concerns about wages and environmental and human rights issues.

For now, the dissatisfaction showing in Seattle is less important than a more widespread public optimism about future economic gains. But there is also a simmering concern about the most fundamental of economic issues: wages. And if the overall economic climate becomes less favorable, that disquiet could grow into something far more serious. Andrew Kohut is the director of the Pew Research Center for People and the Press.

There's a study cited in Robert Entmann's article on Framing (POQ some years ago) where respondents had to choose which of two medical treatments to administer to imaginary groups, and the choices were radically reversed depending on whether risks or benefits were emphasized in the frame. REMINDER: DEADLINE APPROACHING, December 9, 1999

CALL FOR PAPERS AND PARTICIPATION, AAPOR 2000 CONFERENCE

The American Association for Public Opinion Research will hold its 55th annual conference in Portland, Oregon in May 2000. AAPOR's Conference Committee seeks proposals for papers, panels, and round tables that will illuminate important research questions, increase the skills of AAPOR's membership, and promote the development of our profession. Deadline for
submission is December 9, 1999.

Papers, panels, and round table ideas on any topic in public opinion and survey research are welcomed for consideration for next May's conference. We encourage participants to form sessions with common themes and to submit their papers together. These papers will, of course, be considered individually if for some reason the session is not used.

CONFERENCE THEME

Since this will be our first conference of the 21st century, we especially encourage thoughtful papers and panels that focus on the challenges ahead. This would include the following:

-- Impact of technology on public opinion/communications research
-- New insights from data mining
-- Internet surveys: where do we stand?
-- Cross-national research: opportunities and pitfalls
-- The 2000 Census: a methodological assessment
-- Understanding the voter in the 2000 elections
-- Consumer and lifestyle trends
-- Legislative/political threats to public opinion research
-- Retaining customers/customer loyalty
-- Generations "X"and "Y"/generational analyses
-- Sources of response bias/measurement error

AAPOR/WAPOR CONFERENCE

This conference is a joint AAPOR/WAPOR conference year. We encourage
submissions on topics of interest to WAPOR’s world-wide membership.

SUBMISSIONS FROM COMMERCIAL RESEARCHERS

We particularly encourage the submission of panel, round table and paper presentations that will appeal to those working in the commercial sector. Please feel free to contact the conference chair with ideas that may depart from the normal conference paper format.

ABSTRACT SUBMISSION

Please submit your proposal or abstract (of no more than 300 words): INCLUDING TWO OR THREE KEY WORDS DESCRIBING THE TOPIC, by December 9, 1999. Please fit your proposal onto one page and include the name, mailing address, telephone number(s) and email address of the principal author. Use an additional page if necessary for the same information about the other authors. You will receive confirmation that your proposal has been received. Final decisions about the program will be made by the end of January 1999 and you will be notified about the status of your proposal shortly thereafter.

Our preference is to receive abstracts electronically through the AAPOR website: www.aapor.org. This feature will be ready shortly. Please click on "Conferences" for submission instructions. If you do not have Internet access, submit three copies of your abstract directly to this year’s Conference Chair:

Mark A. Schulman
We look forward to seeing you in Portland!
DEADLINE REMINDER:  December 9, 1999

ANNUAL AAPOR STUDENT PAPER COMPETITION
Open to Current Students and Recent Degree Recipients

55th Annual Conference
American Association for Public Opinion Research

Doubletree Hotel, Portland Oregon
May 18-21, 2000

The American Association for Public Opinion Research will award its 34th Annual Student Paper Prize this year. The prize is open both to current students (graduate or undergraduate) and to those who graduated during calendar year 1999. The research must have been substantially completed while the author(s) was enrolled in a degree program. AAPOR will consider papers in any field related to the study of public opinion, broadly defined, or to the theory and methods of survey and market research, including statistical techniques used in such research. Past winners have come from many fields, including political science, communication, psychology, sociology, and survey methods.

Paper topics might include methodological issues in survey, public opinion, or market research, theoretical issues in the formation and change of public opinion, or substantive findings about public opinion. Entries should be roughly 15 to 25 pages in length and may have multiple authors. All authors on an entry must meet the eligibility requirements for the prize.
A prize of $500 will be awarded to the winning paper; in addition, one or more papers may receive an Honorable Mention and be listed in the 2000 Conference Program. The entries will be judged by a panel of survey researchers selected from AAPOR’s membership, including researchers drawn from the academic, government, and commercial sectors. The winning paper and any Honorable Mentions will be invited to present their papers at AAPOR’s 55th Annual Conference, to be held in Portland, Oregon, May 18-21, 1999.

Please mail FIVE COPIES OF EACH ENTRY, TO ARRIVE BY DECEMBER 9, 1999, to this year's Chair of the Student Paper Competition:

Dr. Dianne Rucinski  
Chair, AAPOR Student Paper Competition  
Health Research and Policy Centers (MC/275)  
University of Illinois  
850 West Jackson Boulevard, Suite 400  
Chicago, IL 60607-3025  

Voice: 312-996-7222  
E-Mail: drucin@uic.edu  

Please include your name, mailing address, telephone number(s), and, if possible, an e-mail address. You will receive confirmation that your paper has been received. Final decisions about the winner and the inclusion of papers in the program will be made by early February. You will be notified about the status of your paper shortly thereafter.
In a reply concerning a query about measuring attitudes toward gambling and risk taking, I volunteered Paul Slovic's non-UO address as the Oregon Research Institute. Actually his address (when not at the Univ. of Oregon psych department) is at Decision Research in Eugene. Also, I think the Entmann article on framing appeared in the Journal of Communication, I believe, not POQ. My thanks to a colleague who corrected me on Paul's address. Jim Lemert

Can anyone think of papers, articles or results that can be used to support the following statement?

"For almost all surveys, response rates are lower for minorities, the poor, the poorly educated and young adults,..."
I have reviewed quite a few studies of differences between respondents and nonrespondents and my own reading is that there isn't a whole lot of evidence to support such a characterization of nonrespondents to "almost all surveys". The context here is primarily government sponsored surveys that try to gather factual information (about health insurance, employment, family income, etc.). What is the best evidence out there in support of the above statement?

VACANCY ANNOUNCEMENT FOR European Public Opinion Analyst

SALARY: $40,714 TO $63,436, ANNUAL depending upon experience.

With the U.S. Department of State in Washington, DC

ANNOUNCEMENT NUMBER: AR0244

All applicants must be U.S. citizens.

OPEN DATE: December 1, 1999   CLOSING DATE: January 12, 2000

** You MUST request application materials, or apply on-line, by the
closing date 01/12/00. You then have until 01/19/00 for your
completed application to be received in the Raleigh Service Center.

**

ABOUT THIS POSITION: The incumbent serves as a Research Specialist in
the European Branch of the Office of Research. He or she initiates,
plans, and oversees public opinion research studies in Europe, and
analyzes relationships between public opinion and political, economic,
and social issues in the region. The work includes (1) planning and
overseeing public opinion surveys; (2) reporting results from such
polls and others acquired in the region by writing clear, concise, interpretative briefing papers and memoranda for top-level officials in the United States Government foreign policy community; and (3) keeping up with activities and developments in Europe. Applicants must be able to obtain a special sensitive security clearance. This position has promotion potential to GS-13.

All applicants must have in-depth knowledge of survey research methodology and quantitative data analysis with regard to European and EU political and social issues.

Other job responsibilities include identifying and employing new techniques and methods to analyze public opinion; assessing the validity, accuracy, reliability, and relevance of information and polling results received, giving briefings on issues related to public opinion, and the potential to write articles about European political, economic, and social issues for professional publications or journals.

See for more information:
http://www.usajobs.opm.gov/wfjic/jobs/AR0244.HTM

I am mentoring an HS student who is competing in a National Science Foundation program. He is conducting a research project among college students about their political attitudes and vote choices.

We have already completed a sample of northern students and are now looking for additional southern schools that might be able to participate.
We are looking for about 100 completed interviews in a 4 year college -
social sciences classes are ok, probably preferred since these were in our northern
school sample. (Southern school = any state of the former confederacy.)

If you can help us out, please E-mail me at HOEYD@SUNYNASSAU.EDU.

Thank You.

Patrick Hoey
I am wondering if anyone has experience with long-term studies that manage to do re-contacts later while still protecting a subject's anonymity?

Of course there is a whole body of literature about sensitive issues and the impact of offering anonymity, particularly the studies on drug use, and behaviors associated with HIV.

But it's the follow-ups that seem to throw in a new wrinkle, and I can't seem to find much on systems that would allow both recontacts and assurances of anonymity. (Well, not surprising. This is a real challenge!)

Any recommendations, references, or anecdotes?

Thanks bunches,

Colleen K. Porter

I am looking for any publicly released survey/poll data on the topic of broadening the term "youth" to include kids ages 18 to 24. Many government studies on "youth" now go beyond 18 year olds and include kids up to the age of 24 - formerly considered young adults.

Ultimately, I am looking for survey data on whether the public has an opinion on whether or not 18-24 year olds should be classified as "youth"
and/or under what circumstances is this necessary or not. Not exactly a common public opinion polling topic, but survey/poll results could also include
such ancillary topics as whether the public support/oppose legislation to "protect" this age group by supporting/opposing raising the minimum age for drinking/smoking/driving etc.

Part of the context is this:
Recent push to try 12 and 13 year olds as "adults" is out of sync with efforts to classify 18-24 yr olds as "youth." What does public opinion data show, what issues make the public draw the line...

Please send any responses directly to me at jon.richter@pmmc.com. Thank you.

Jon,

I can't help myself from making a personal "value-laden" comment about what I consider to be a very ill-advised way of thinking vis-a-vis public policy formulation to label adults who happen to be 18-24 years old as "kids" or "youth." In saying this I am not suggesting that you necessarily think this way, as I have heard of this perspective before.

But I agree that it's good to seek information about how pervasive this way of thinking is among the public and elites.

At 10:14 PM 12/7/99 EST, you wrote:

Are you referring to anonymity, or confidentiality? If the latter, would you consider mentioning the possibility of a follow up at the time you ask for participation? Or even asking whether follow up would be acceptable? The mention is preferable to the question, since the "no" answers may increase response bias at the follow up stage.

I have a study that requires a similar approach to protect sensitive information, although it is with a professional population. The only solution I have come up with so far is to keep the returned data totally anonymous, but maintaining the subject address file. Although maintaining anonymity, there are several drawbacks to this approach.

First, there is no way to link an individual's data across waves. Second, I'm not certain that subjects who are re-contacted will feel as secure about the anonymity factor. Third, during follow-ups, we will be pursuing people who may not want to be pursued. We have partially resolved this dilemma by including a return postcard with a subject identifier that allows subjects to exclude themselves so we can eliminate them from our roster. The completed questionnaires can be returned separately without identifiers. If conducted by CATI, the subject file can indicate the subject disposition, but the data can be collected and not linked to a subject.

If others know of better ways to handle this, I'd like to know also!

This subject is getting a lot of attention, given the increasing number of longitudinal surveys, although work has been done on it for a long time. The NAS/Committee on National Statistics held a workshop in October on the subject. See below. Especially active have been the American Statistical Association Committee on Privacy and Confidentiality (see www.amstat.org, I believe) and an Interagency Committee on Confidentiality and Data Access, which has developed a very useful checklist and, I believe, will be directly attention to the "longitudinal issue." The ASA site has a list of very useful references that are invaluable.

I told Mark Shulman that I’d be willing to organize or chair a session on
this topic, if there is enough interest.

Our unit has performed several telephone interviews of national probability samples on topics related to HIV risk and prevention (i.e., sexual behavior, substance use, etc.) since the late 80s. As part of the "informed consent" section we guarantee confidentiality, not anonymity. The interviews, some of which were more than an hour long, always end with a question asking the respondent if they are willing to participate in a follow-up interview. In our last national probability sample, 73% of those who completed the interview said "yes" to this question. Our most recent study was a probability sample of men who have sex with men living in four U.S. cities (completed in 1998). Almost 89% of respondents who completed the interview agreed to a follow-up.

For re-contact information we ask for name, address, and date of birth so that we can confirm the person we are talking to is the respondent. We also ask for the name and telephone number of a contact person, someone who would
know where to reach the respondent in case we lose contact. All this information is of course optional. Respondents often give first names or nicknames or aliases only, and address is often refused. We try to recontact respondents every 6 months to update this information and relay information about the progress of the study (without influencing future responses).

This recontact information is kept in a separate file held by our data collection subcontractor. We hold the data file (answers to the baseline interview). The two can be linked by an ID number, but no one is allowed access to both files. This preserves the confidentiality of the respondents.

Subject: French public opinions data needed

Hi,

I am helping a library user to locate any current polls or surveys done in France about French people's attitudes toward the United States. French president, Jacques Chriac has criticized U.S. being a hyper power and my user like to know if any public opinions have been gathered in recent years (preferably after 97) in France about French people's view about U.S. Any lead to published data will be appreciated. Thank you for your help!

Lu Chou, Special Librarian
Our Center has been asked by the State to oversee a statewide survey of HIV/AIDS knowledge, attitudes, beliefs, and behaviors. This general
population telephone survey will be fielded by a contractor that we selected. The Contractor has substantial experience conducting HIV/AIDS surveys in both the general population and in high risk groups.

Our problem is the State's Institutional Review Board (IRB) which must approve the study protocol prior to our fielding this survey. The original protocol we submitted was based upon two previous HIV/AIDS surveys conducted by the State in 1987-1988. The IRB trashed our protocol on the following grounds:

1) Concern about maintaining confidentiality of the data -- These concerns are easy to address as our Center and the Contractor have had considerable experience in this area.

2) Concern about informed consent -- We can address this concern by incorporating in the interview a lengthy introduction that discusses the potential costs and benefits for participating in the survey and by providing several opportunities for respondents to decline or postpone participation. We recognize that this will have a negative effect on our respondent cooperation rate but see little option other than to comply with the IRB's demands.

3) Concern about the utility of general population telephone surveys -- This is the issue for which we need the most help.

3a) The IRB is sophisticated enough to know that we are unlikely to achieve a high response rate. Even with 30 call attempts and highly trained and experienced interviewers, we will be lucky to achieve a 50% CASRO response rate due to our need to satisfy concern #2. (In recent
years other California general population telephone surveys have yielded 40-55% CASRO response rates.) We know that low response rates are problematic in estimating population parameters only if nonrespondents systematically differ from respondents on the key variables of interest. Several survey researchers have suggested to us that they believe that nonresponse bias is actually less in surveys with low response rates (i.e., less than 60% CASRO) than surveys with high response rates (i.e., greater than 70% CASRO). However, we have not been able to find any empirical evidence to back up this assertion and would appreciate receiving any papers or references to support this claim.

In the data analysis, we proposed to compare responses from those who required more call attempts (a proxy for nonresponders) to those who required fewer call attempts in order to estimate the potential response bias. We also plan to contrast sample demographics with updated Census estimates and weight the sample to the population as appropriate.

3b) The IRB is also concerned that many respondents will be unlikely to report honestly about behaviors that put themselves at risk for HIV infection (e.g. condom use, number of sexual partners, intravenous drug use). We share this concern and plan to take numerous precautions to enhance response validity (e.g., highly trained interviewers, carefully worded introduction and questions, cognitive interviewing, pilot testing, etc.). Besides, the assessment of high risk behaviors is a secondary aim of this study.

We have submitted a revised protocol that we believe adequately addresses the IRB’s concerns with the exception of concern #3a. We get to defend the
revised protocol before the IRB on Friday morning and would greatly appreciate your suggestions on how to handle this concern.

The key to this is to ask for permission to call back prior to completing an initial interview and then getting only the first name while continuing to assure the respondent that their answers will be kept confidential and not be contributed to them. In this manner, the respondent is still assured anonymity and confidentiality.

It has worked for us on numerous occasions.

Best of luck with your study.

It appears to me that the California IRB is attacking the protocol on grounds of reliability and validity of the study design. While it is commendable that they are so carefully reviewing the study design, isn't this stepping outside their role? I will admit my ignorance on this issue, but I thought the role of an IRB was to ensure that rights of the human subjects are not in any way compromised. If this is true, then the IRB concerns can be acknowledged, but the study should be allowed to proceed.

I would appreciate comments from those who can clarify this.

That was my first reaction too, but I suspect it won't solve Joel's immediate problem. I think about all that can be done here is to try to educate the board on (1) the consequences of their ridiculous position on informed consent; and (2) the procedures that will be used to assess and analytically control for the impacts of non-response bias on survey parameter estimation.

I would not try to argue that high non-response equals low non-response bias for two reasons. First, the empirical evidence supporting this notion is extremely weak; and second advancing this position will only serve to reinforce the perception that you do not know how to deal with this problem.

Why not propose a small scale calibration study designed to quantify the impacts of non-response bias on the survey's estimates?

This appears to be a case of the State hobbling its own survey effort. You would think there would be somebody in the State government who could look down on this situation and declare either that the data is urgently needed and therefore the IRB will have to live with an informed consent statement that is no more than two sentences long or that the data is really not that
necessary and since the result is likely to be junk anyway given the IRB's requirement, the effort ought to be halted altogether.

Point taken. But I will reiterate: is cost-benefit assessment the responsibility of the IRB? In this case the funding sponsor (the state of California) is also the institution coordinating the review board. To me, an ideal situation would be to have the IRB assess human subjects rights issues and have the sponsoring agency do the cost-benefit analysis.

For an IRB the cost-benefit ratio, also known as the risk-benefit ratio, has little to do with money, but rather an assessment of the costs or risks to participants relative to the anticipated benefits and importance of the knowledge that might reasonably result from the research (this comes directly from the federal regulations). Some IRB members feel it is unethical to waste the time of subjects on research that is unlikely to yield usable knowledge (even if there are no other foreseeable risks). Consenting subjects are sacrificing their time and privacy to participate with the understanding that it will make a meaningful contribution to science or society. Thus, the researcher must be able to convince the IRB that the research is worth doing using the proposed methodology. In this case, I feel sure you can do so (but probably not by arguing that this concern is outside their realm of responsibility).

I would like to thank all who responded to my earlier message regarding defending phone surveys before an IRB. This is my week for problems so I would like to raise a major problem I have been having for the past year with another study.

We are trying to do a telephone survey methods study with adolescents (12-17 years of age) in California, but we’ve been having difficulty finding adolescents. According to the 1998 Current Population Survey, the incidence of households in California with adolescents is 18%. Given the study’s budget in order to obtain enough interviews for the methods study, we need to obtain an 18% incidence of adolescents.

To date, we have conducted four pilot studies and the incidence of eligible youth was 16%, 9%, 12% and 11%, respectively. In the first three pilots we used a list-assisted (1+ working block) RDD design. The disproportionate stratified sample design included an oversample of areas that had greater
concentrations of African American households.

In the first pilot we completed a screener with an adult in the household in which we informed the adult we were doing a tobacco survey, enumerated the household, collected some proxy information on tobacco use, and then if there was an adolescent in the household, we asked for permission to interview the adolescent. The contractor felt that the screener took too long and that we were losing too many potential households, so for the second pilot we modified the screener introduction to simply state that we were doing an adolescent tobacco survey, asked whether there was an adolescent in the household, and then asked permission to interview the adolescent. (If there are multiple adolescents we select one at random.)

In the third pilot we cut the screener even more in an attempt to reduce refusals and break-offs.

In the fourth pilot we used the same introduction as the third pilot, but we modified the sample design in an attempt to improve incidence. A major sampling firm created a four strata design. The first stratum contained listed telephone households that had a score of 5-9 on an indicator created by Donnelly of the likelihood that the household contained an adolescent. The second stratum contained listed telephone households that had a score of 1-4 on this indicator. The third stratum contained listed telephone households with a score of 0. The fourth stratum contained unlisted telephone households that did not fall into any other stratum and came from a 1+ working block. For this pilot we sampled 150 phone numbers from stratum 1, 104 numbers from stratum 2, 0 numbers from stratum 3, and 107 numbers from stratum 4. The working rate was about 90% in strata 1 and 2 and 60% in stratum 4. The incidence of adolescents was 18% in stratum 1,
8% in stratum 2 and 0% in stratum 4 yielding an overall incidence of about 11%. Thus, we did not do any better in finding adolescents than our previous surveys. The Contractor and the Sampling Firm checked over the sample file to ensure that no mistakes were made.

Obviously, if we decided to confine our study to stratum 1, we could obtain the necessary incidence of adolescents; however the study would have little generalizability because this stratum represents about 3% of the sampling frame so we do not want to do this.

Although the sample sizes for these four pilot studies are rather small, the data suggest that the first pilot study had the best incidence. The first pilot study is the only one in which we introduced the survey as a general population tobacco survey and later informed the respondent that we wanted to interview an adolescent. In subsequent studies the survey was introduced as an adolescent tobacco survey. Several researchers we have talked to have hypothesized that our problem is that by introducing the survey as an adolescent tobacco survey it's too easy for adults to falsely claim that there are no youth in the household, and that this is why our incidence of adolescents has been so poor in the last three pilots. Is anyone aware of empirical evidence to support this hypothesis?

We would be most grateful to receive creative suggestions as we are wasting precious time and resources trying to resolve the problem of how to boost the incidence of adolescent interviews.

Subject: Re: Defending general population telephone survey
This is about the fourth time I have been appraised of something like this with IRBs in the last two months! I speak as a former IRB member and a survey researcher who has had some interesting times.

(1) most surveys of consenting adults are EXEMPT from IRB review; this means that the IRB chair simply looks over the proposal, introduction, etc. to be sure that it meets the Federal exemption guidelines. The proposal, etc. does not go to full IRB review. However, a survey on sensitive topics such as AIDs-related behaviors would go to full committee review.

(2) The "territory" of IRBs is the protection of human subjects. It is not research design although the PI may pick up some helpful hints. It does not matter whether someone on the state IRB got bothered by a survey researcher calling them at dinner. This is not a human protection problem. I have seen some farflung opposition to surveys (the phone rings and the autistic child loses control) that would invalidate telephone calls, period.

If the State IRB is imposing federal guidelines, demand to see a copy of the guidelines (or get your copy from Berkeley or the fed Office of Research Risks.) The Guidelines, in fact, are reasonable and are aimed with human protection in mind. The last thing they do is disparage surveys.

(3) I don't know what to tell you about the leemnnngthy informed consent intro. I have pointed out to our IRB that the place for many sensitive intros is directly before the questions involved. Otherwise, the respondent may have forgotten the intro within a couple of minutes. To have a droning, boring introduction may fill the letter but not the spirit of informed consent.
(4) Key elements are: reminding respondents their total participation is voluntary, the responses are confidential (or anonymous if that is true), noting there is a contact point if the respondent has further questions, noting the approximate time the survey takes, the sponsoring agency and the survey location. An adequate intro meeting all these points should not take more than 45-60 seconds.

GOOD LUCK!
Susan

Colleen, I haven't forgotten but have been swamped.

empirical evidence to back up this assertion and would appreciate receiving any papers or references to support this claim.

In the data analysis, we proposed to compare responses from those who required more call attempts (a proxy for nonresponders) to those who required fewer call attempts in order to estimate the potential response bias. We also plan to contrast sample demographics with updated Census estimates and weight the sample to the population as appropriate.

3b) The IRB is also concerned that many respondents will be unlikely to report honestly about behaviors that put themselves at risk for HIV infection (e.g., condom use, number of sexual partners, intravenous drug use). We share this concern and plan to take numerous precautions to enhance response validity (e.g., highly trained interviewers, carefully worded introduction and questions, cognitive interviewing, pilot testing, etc.). Besides, the assessment of high risk behaviors is a secondary aim of this study.

We have submitted a revised protocol that we believe adequately addresses the IRB’s concerns with the exception of concern #3a. We get to defend the revised protocol before the IRB on Friday morning and would greatly appreciate your suggestions on how to handle this concern.

The value of the study to science/society is indeed something that an
IRB should take into consideration. It is considered unethical to waste
people's time, mislead them into thinking they are contributing, etc.

However, the IRB should be concerned with 1) "risk" to the participants
which in this case means mainly the risk of breach of confidentiality,

NOT risk that the questions will take too long, etc., and 2) that the
methodology proposed is accepted by the professional research community. Sample selection is quite definitely an accepted method of obtaining research "subjects." Multiple callbacks have also been found to be effective in increasing participation. If the methods are accepted and rigorously applied, you can point that out to the IRB.

Yes, do stress your plan to make comparisons within the data file to estimate response bias. I have not heard of the equivalent being done in medical research, although there has been some concern that women and members of minority populations are "underrepresented."

RDD is a much more effective way of minimizing bias in studies than is placing ads in various places and hoping that the volunteers show up give you in their composite an unbiassed picture of the "universe" (what universe?) That holds true for random selection from a list.
I disagree with both the notion that IRB's are in a position to judge whether or not a particular research protocol 'wastes' the subject's time, and that 'wasting time' is a 'risk.'

I believe that decisions about whether a project should be fielded are also the responsibility of all the other checks along the chain--at my institution each protocol must also be approved by a department chair (sometimes also a department committee), a college dean, and the office of the vice-president for research. Perhaps more significant is that large-scale research of the type being discussed must also pass review at the funding agency (as others have pointed out).

To me these are the agents more likely to be able to judge the merits of a research protocol. I have some experience on our IRB, including a year as chair, wherein I signed 1100 protocols. Yes, some were, to me, not very 'good' research. But it was clear to me that the IRB and I were not the only links in the chain from idea to interview.

The section on risks in relation to benefits that Debra McCallum cites is at 46.111 (a)(2) 'Criteria for IRB approval of research' (link below). My reading is that the 'risks' here are the very real risks of certain medical research. Some survey research can approach these risks, and must take commensurate precautions--e.g. the hiv seroprevalence study pilot tests and the extreme precautions taken to protect confidentiality and still provide respondents with their test results.

We might be trivializing these protections in extending them to the (voluntary) 'wasting' of time. Let's not forget the real horrors that led to
the adoption of these regulations.

Let everyone read for themselves: in case you don't have it bookmarked, the National Institutes of Health, Office of Protection from Research Risks is at:

http://grants.nih.gov/grants/oprr/oprr.htm

The Human and Animal Subject library is at:

Many interesting publications accessible from there, including the full Code of Federal Regulations 45 CFR 46 - 'Protection of Human Subjects' online at:

Yes, 'benefit assessment' is within their purview, since they are charged with determining if the potential gain of knowledge from the study is adequate to justify any possible risk to human subjects. MB

Dear All:
I do not think that the IRB can assess surveys on the basis of risk benefit. The real risk from survey research is disclosure. There would be ancillary risk if the survey questions were "upsetting" to the subjects.

On the risk scale these are very low compared to medical experimentation, which is where this came from.

They should follow the Federal guidelines. Even surveys of "vulnerable" populations can be subject to merely expedited review.

IF the IRB is claiming that they can assess the value of the research they have gone way beyond their role.

I daresay that most of the Nobel prize recipients were told one time or another by their colleagues that their work was useless. The history of science shows the impossibility of forecasting utility/benefit. I would respectfully suggest that the IRB keep its attention focused on the protection of human subjects.

Subject: Everett Carll Ladd 1937-1999
Mime-Version: 1.0
Content-Type: text/plain; charset="us-ascii"
Everet Carll Ladd
(1937-1999)

Everet Carll Ladd Jr, a distinguished social scientist and nationally renowned polling expert died Wednesday morning at Windham Community Memorial Hospital after a brief illness. He was 62.

Ladd, a professor of political science at University of Connecticut since 1964 recently retired as director of the Institute for Social Inquiry and Executive Director of the Roper Center. One of the University's most prolific writers, Ladd wrote and edited more than 20 books, including a textbook, The American Polity, now in its sixth edition. Many of his articles appeared in the nation's leading newspapers including the Wall Street Journal, the New York Times, the Chronicle for Higher Education, the Hartford Courant and many others. He commented frequently on politics and was the most widely quoted of UConn's faculty.

"This is a loss not only to me personally and to the University of Connecticut but to the body politic. Everett's contributions to the public dialogue on issues of national policy, through the many books and dozens of commentary pieces he wrote, were often intriguing and always informative. His ability to analyze poll results, in all their intricacies, was beyond reproach. I will miss his friendship, and the community will be lessened by the loss of his scholarship and wit," UConn President Philip Austin said Wednesday.
"Many of our colleagues have had the privilege and pleasure to know leading figures in their disciplines. For those in the social sciences and, especially, political science, I know that Everett Ladd is looked upon as somewhat of a legend. The Roper Center is truly one of our centers of excellence and the University has Everett Ladd to thank for that, for his role in guiding its development for more than two decades," added Robert Smith, vice provost for research and dean of the graduate school.

Under Ladd's leadership, the Roper Center, founded in 1946 by Elmo Roper has become the premier archive of polling data in the world, with data from more than 14,000 major national and international surveys and the first ever online information retrieval system for public opinion data from the United States and abroad. He also expanded the Roper Center's mission with an ongoing publications program, including the bimonthly journal, Public Perspective, the biennial election analyses America at the Polls, and a series of issue-specific monographs.

Burns Roper, son of the founder of the Roper Center and long time chairman of its Board had this to say of Everett's passing, "the remarkable growth of the Center and the recognition it has achieved over the last 20 years is due almost entirely to Everett and the staff he assembled."

Along with his positions at UConn and the Roper Center, Professor Ladd served as adjunct scholar of the American Enterprise Institute for Public Policy Research in Washington. From 1987 through 1995, he was a columnist
for The Christian Science Monitor. He has been a Fellow of the Ford, Guggenheim, and Rockefeller Foundations, the Center for International Studies at Harvard, the Hoover Institution at Stanford, and the Center for Advanced Study in the Behavioral Sciences (Palo Alto, California). He was an internationally recognized authority on American public opinion and the role of survey research in democracy.

He served for a decade as senior editor of Public Opinion magazine and then for six years as "Opinion Pulse" editor for The American Enterprise magazine. Collaborator and co-author, Karlyn Bowman, resident fellow at the American Enterprise Institute offered, "Everett was that rare person who could combine scholarly excellence with perceptive insights into the realities of the public policy world. He willingly shared that knowledge with decisionmakers, students and fellow researchers."

Ladd's recent work went beyond his traditional interests in American political thought, electoral politics and public opinion. The Ladd Report: The Surprising News of an Explosion of Voluntary Groups, Activities, and Charitable Donations That is Transforming Our Towns and Cities, analyzed volumes of data regarding how voluntary groups, activities and charitable donations were reshaping America's towns and cities.

Ladd leaves his wife, Cynthia Louise (Northway) Ladd; four children: Everett Carll Ladd III and his wife, Elizabeth; Corina Ladd and her husband David Kirocofe of Connecticut; Melissa and Paul Teed of Michigan; Benjamin and Wendy Ladd of Georgia; five grandchildren: Ryan, Rachael, Kelley, Michelle, and Daniel; and a sister and brother-in-law, Mary and Stanley Tucker of Maine. Funeral services will be private, and there will be no calling hours. Interment will be in Storrs Ceremony. In lieu of flowers
donations may be made to the Everett Carll Ladd Fellowship at the
Department of Political Science, University of Connecticut. A public
memorial service will be scheduled at a later date. Potter Funeral Home,
Storrs Road, Mansfield, CT is in charge of arrangements.

At the risk of stretching this one out...

Most people on University IRBs are NOT social scientists, let alone survey researchers. If you examine the Guidelines (thanks to Ed and Shap for the WEB site), you will see that they mandate a Philosopher in ethics, a medical doctor, a community representative--but there is no mandate for a social scientist! My IRB has one at a time.

Thus, I debate most members of an IRB judging the worth or benefits of research in another discipline--which is way outside the Guidelines anyway. As has been pointed out, departments and colleges assess this usually before
it comes to an IRB. This is a serious threat to academic freedom. To allow members from one discipline to decide whether research from another "wastes subject time" is a Pandora's Box that I hope we choose to remain closed. I am old enough to remember how federal Senate William Proxmire tried to gut funding for the highly useful research on physical attractiveness and Rubin, Peplau's etc. research on attraction saying that the American public did not want to know what made them fall in love (most of my undergraduate students have vociferously disagreed with Proxmire.)

Very often years go by before we give a discovery its due.

The IRB is there to assess risk to human subjects from medical, physical and social research. It is there to see that subjects are not coersed or otherwise defrauded into participating. It is there to see that research participations and their information are treated with dignity, research, and privacy. With some noteworthy objections, that is what most IRB members try to do.

Susan

If time were money, I'd be in debtor's prison.

I'll be teaching an undergraduate public opinion class next spring for the first time in seven years. I would like to expose students to the mechanics of CATI but probably can't get the funds to license a full-blown professional system.
Years ago, some student-oriented analysis programs included a rudimentary component that functioned as a CATI system (or at least mimicked what it would be like to be an interviewer).

I would welcome suggestions that would be appropriate for teaching (35-50 students, I would guess) and conducting a brief telephone survey. I should have some funds but price is likely to be a major concern.

Thanks!!

I don't think you can make a blanket statement about the competence of IRBs to assess the quality of research design. I am on an IRB that is composed of medical professionals, many of whom have been involved with research themselves. It would not be just or wise to question their competence, and they do sometimes have to decide whether the value of a proposed research project is worth the risk.

Some "funding agencies" have trained and good researchers on board, some do not. Some are "disinterested," and some may not be. Relying on them in every case to make sure a study design is adequate is risky.

Prejudices for and against different research methods do exist. Usually the prejudice is for the method one applies oneself. There is a sort of myth (oh, no -- I'm not prejudiced!) that survey research is not valid because "there is no control." IRB members who are not familiar with survey research know about the low response that surveys contend with, if nothing else. If an institution fields a lot of survey research, it should have a survey researcher on the IRB.

Have you tried QPL? I cannot vouch for it but know of centers that use it. It is a fairly complete CATI system that I believe can be downloaded for free from the GAO website.

Good Luck.

On December 9, 1999, Eric Plutzer mentioned teaching an undergraduate public opinion class next spring, with an interest in exposing students to the mechanics of CATI but facing funding constraints for a full-blown professional system. He was exploring QPL, a free version released last month with Y2K fixes, still the same version 4.0 from 1996. It is a collection of MS/DOS programs (under Windows, no mouse input) that is still free but may not suit everyone's preferences for writing questionnaires in QPL language.

A new version of QPL (4.1) has been released, but it is still essentially the same version 4.0 from 1996. It includes Y2K fixes but remains a collection of MS/DOS programs that run under Windows, without mouse input. Writing questionnaires in the QPL language may not be everyone's preference. plutzer@uga.edu shared the updated QPL website: http://www.gao.gov/qpl/qpl.htm

Manfred Kuechler, Sociology Department at Hunter College (CUNY), provided an alternative: http://maxweber.hunter.cuny.edu/socio/faculty/kuech.html

Do you really need CATI or is all you need the Ci3 (Sawtooth) questionnaire authoring side of the system. Ci3 can be set up to run outside of the CATI environment as a stand alone. If all you want to do is show how the interviewer sees the process this may be sufficient. If so, you may be able to get the owner of a CATI/Ci3 system to author a couple of questionnaires that students can run
from a diskette. I believe Ci3 can be purchased alone as well,

Regarding Joel's question on RDD screening for adolescents, a paper on this
subject was presented at the 1999 AAPOR conference by John Tarnai, Marion Landry, and Rod Baxter of Washington State University.

I recall that they had a similar finding as Joel's, that is, that the incidence of households with adolescents was higher among samples that were enumerated prior to identifying the survey as targeting adolescents.

Subject: Locating adolescents in a phone survey

>I would like to thank all who responded to my earlier message regarding defending phone surveys before an IRB. This is my week for problems so I would like to raise a major problem I have been having for the past year with another study.
>
> We are trying to do a telephone survey methods study with adolescents (12-17 years of age) in California, but we've been having difficulty finding adolescents. According to the 1998 Current Population Survey, the incidence of households in California with adolescents is 18%. Given the study's budget in order to obtain enough interviews for the methods study, we need to obtain an 18% incidence of adolescents.
To date, we have conducted four pilot studies and the incidence of eligible youth was 16%, 9%, 12% and 11%, respectively. In the first three pilots we used a list-assisted (1+ working block) RDD design. The disproportionate stratified sample design included an oversample of areas that had greater concentrations of African American households.

In the first pilot we completed a screener with an adult in the household in which we informed the adult we were doing a tobacco survey, enumerated the household, collected some proxy information on tobacco use, and then if there was an adolescent in the household, we asked for permission to interview the adolescent. The contractor felt that the screener took too long and that we were losing too many potential households, so for the second pilot we modified the screener introduction to simply state that we were doing an adolescent tobacco survey, asked whether there was an adolescent in the household, and then asked permission to interview the adolescent. (If there are multiple adolescents we select one at random.)

In the third pilot we cut the screener even more in an attempt to reduce refusals and break-offs.

In the fourth pilot we used the same introduction as the third pilot, but we modified the sample design in an attempt to improve incidence. A major sampling firm created a four strata design. The first stratum contained listed telephone households that had a score of 5-9 on an indicator created by Donnelly of the likelihood that the household contained an adolescent. The second stratum contained listed telephone households that had a score of 1-4 on this indicator. The third stratum contained listed telephone households with a score of 0. The fourth stratum contained
unlisted telephone households that did not fall into any other stratum and
came from a 1+ working block. For this pilot we sampled 150 phone numbers
from stratum 1, 104 numbers from stratum 2, 0 numbers from stratum 3, and
107 numbers from stratum 4. The working rate was about 90% in strata 1 and
2 and 60% in stratum 4. The incidence of adolescents was 18% in stratum 1,
8% in stratum 2 and 0% in stratum 4 yielding an overall incidence of about
11%. Thus, we did not do any better in finding adolescents than our
previous surveys. The Contractor and the Sampling Firm checked over the
sample file to ensure that no mistakes were made.

Obviously, if we decided to confine our study to stratum 1, we could obtain
the necessary incidence of adolescents; however the study would have little
generalizability because this stratum represents about 3% of the sampling
frame so we do not want to do this.

Although the sample sizes for these four pilot studies are rather small,
the data suggest that the first pilot study had the best incidence. The
first pilot study is the only one in which we introduced the survey as a
general population tobacco survey and later informed the respondent that we
wanted to interview an adolescent. In subsequent studies the survey was
introduced as an adolescent tobacco survey. Several researchers we have
talked to have hypothesized that our problem is that by introducing the
survey as an adolescent tobacco survey it's too easy for adults to falsely
claim that there are no youth in the household, and that this is why our
incidence of adolescents has been so poor in the last three pilots. Is
anyone aware of empirical evidence to support this hypothesis?

We would be most grateful to receive creative suggestions as we are wasting
precious time and resources trying to resolve the problem of how to boost
>the incidence of adolescent interviews.

Hello Eric,

We at CfMC have an active program of making our widely used CATI system
available at little or no cost to academic institutions for the purpose of
teaching students how to use a good CATI system. I am very interested in
having you use SURVENT for teaching students because of the heavy demand in
the industry for experienced SURVENT users.

SURVENT is the system used by more interviewers in the U.S. than any other
system on the market. We have many clients who are desperately looking to
hire people with experience in SURVENT. If you expose students to the
system, it will greatly enhance their ability to find jobs in the MR
industry.

If you are interested, please call me.

Richard Rands
Years ago, some student-oriented analysis programs included a rudimentary component that functioned as a CATI system (or at least mimicked what it would be like to be an interviewer).

I would welcome suggestions that would be appropriate for teaching (35-50 students, I would guess) and conducting a brief telephone survey. I should have some funds but price is likely to be a major concern.

Thanks!!

My colleagues and I are conducting a study of data collection efficiency and data quality as a function of the month that the data are collected. Much conventional wisdom argues that some times of the year (e.g., summer, holidays) are "worse" than others. We haven't found much data to support this notion. Does anyone have references for studies that support this notion?
Thanks.

Dear Mary (and to other who might respond),

I'd appreciate seeing answers organized by the types of errors that might correlate with seasonality.

That is, Mary's reference to "worse" data by time of year could mean more respondent-related measurement error (e.g., more item-nonresponse due to respondents being rushed), or more unit nonresponse problems (including possible NR error), or differential mode-related errors, or other errors.

The telephone survey units with which I have been associated for the past year years have regularly worked 12-months per year, seven days per week. Many of our projects have dealt with criminal justice issues, and the field knows that various crime-related behaviors and attitudes have a seasonal component. But this isn't measurement error per se.

While I have never done a sophisticated analysis of these issues as they apply to nonresponse, I have always found that unit nonresponse increases around holidays and also a bit in the summer. Whether this is associated with nonresponse error (thus lower data quality) is really the issue, and I too would like to learn what others might know about this.

In newspaper research, there's a well-entrenched myth -- perhaps with some truth behind it -- that seasonality has an effect on readership measures. Higher in the fall and winter, lower in the summer, especially late summer, the conventional wisdom says. I've been in the business now for several decades, and like Paul Lavrakas, I've had some time to observe that there appears to be some seasonality effect for a lot of such things. Unfortunately, like Paul, I've never taken the time to conduct a formal study of those things.

I have been asked by a client to review a questionnaire that many AAPORITES would find offensive. In brief, every question that matters is phrased with the same point of view (isn't management wonderful).

I am wondering if anyone can direct me to research in which question...
wording is slanted one way, then the other, and then value neutral. It would be very helpful to put them on the track of value neutral questions.

Thank you.

We've done "in-person" focus groups; we've read that it's theoretically possible to conduct focus groups via conference call; and we've been asked to do some (topic: marketing of new products).

Question for aaporites: does anyone have any experience(s) to recall about focus groups that were done via teleconferencing?

Figures from the German Politbarometer poll released today
(for those who read a bit of German)
show a remarkable swing in public opinion over a period of just 4 weeks in
the aftermath of a widening scandal about party financing:
Christian Democrats (formerly led by Ex-Chancellor Kohl): from 55% to 43%
Social Democrats (led by current Chancellor Schroeder): from 31% to 41%
in response to a question whom the respondent would vote for if there was
an election next Sunday (a standard question in Germany).

This is a swing of 22 percentage points from +24 to just +2 (in favor of the Christian Democrats) over just 4 weeks.

At the same time, the public has been and still is fairly cynical about parties in general. A solid majority believes that all parties violate the existing laws, take donations, hide them in slush funds, etc., and that, of course, money influences political decision making. What would cause such a change then?

In the US, no scandal seems to have much impact on public opinion -- be it arms deals, sex with interns, lying to the public, corruption, illegal contributions, or whatever. So, the next question is, are these poll results reliable -- given that it is 3-day telephone survey (we talked about this issue quite a bit lately)? Maybe, the conservative voters simply did not feel like participating in the survey this month?

However, there is little indication that most of the swing is caused by selective participation. Checking the recall question (“for which party did you vote in the 1998 elections”) the marginals for the November and the December polls are very similar; a slight drop of the CDU share is offset by an increase in the "non-voter" share with a constant share for the SPD. The plausible explanation is that a small portion of CDU voters preferred to hide their previous vote; but no signs of selective participation.

And thus we are back to the more interesting, the substantive question: What moves public opinion? Can the public be cynical ("all parties do it") and morally disgusted ("you should abide the law") at the same time? And
maybe Reagan’s and Clinton’s ability to be able to get away with almost
anything are exceptions rather than the rule? Are there lessons to be
learnt for the campaign in the US?

Theory is one thing. Reality is something else. Even business meetings where everyone knows everyone else, more or less, are difficult with conference calls. Even teleconferencing, while theoretically/technically feasible, can never take the place of face to face meetings....which is what a focus group is really all about.

didn't he also invent the internet?

Seriously, My firm and I'm certain many others have been conducting focus groups by telephone for a long time. In fact we think they are particularly useful as a check against regular, in person, focus groups. When interviewing physicians for example we find more candor when they are speaking directly by phone (one-on-one) than when they are in a group, especially if one or more of the physicians in the group practice in an academic setting.

I am a bit confused: "Telephone focus groups" a la Richard Day are
conducted "one-on-one" -- because people are more honest this way than in a
group? I had been under the impression that the very essence of a "focus
group" is to have a *group* discussion -- be it in person, via telephone,
via video conferencing, or some hybrid thereof (like a phone conference
call with additional one-way video/audio feed via the Web -- as described
by Silverman).

While there may be doubts about the claim that Silverman is the sole
inventor of "telephone focus groups", I think Richard Day has undisputed
claim to "one-on-one focus groups". There are no limits to creativity ....

By STEVEN A. HOLMES
ASHINGTON -- Less than four months from the start of the 2000 census on April 1, a General Accounting Office report is warning that the Census Bureau's current plans may produce a count that is less accurate than that of 1990.

The accounting office, the investigative arm of Congress, singled out the Census Bureau's decision not to send a second questionnaire to households that do not respond to the first form that the agency mails as a reason for its finding. The agency also expressed concern that the tight labor market might make it difficult for the Census Bureau to hire the large number of temporary workers it will need.

In a draft report, the agency says that the bureau "faces some significant risks, that, taken together, continue to jeopardize the success of the 2000 census."

The report said the census next year would cost $6.2 billion, almost twice as much as the $3.2 billion spent on the 1990 census, which was by far the most expensive in history.

And yet, the report suggested, the 2000 census may not be as accurate as the one in 1990, which was estimated to have missed 8 million people and counted another 4 million twice, for an undercount of about 4 million people.

"It raises concerns," George Walker, communications director for the House Subcommittee on the Census, said of the accounting office report. "Many of these concerns, like doing a second mailing, are ones that we've raised before in hearings, or in
specific legislation."

Investigators for the accounting office said that the Census Bureau might "be optimistic" when it estimated that 61 percent of households would complete and return the census forms that were sent to them. The report said the agency's decision not to mail a second form to households that had not returned the first could hold down the response rate.

Census Bureau officials took issue with the report, noting that last September the accounting office issued another report declaring the bureau's estimates of the form-return rate were conservative.

Kenneth Prewitt, director of the Census Bureau, said, "We're a little surprised that the same agency says we are too conservative and then turns around after a few months and says we are too optimistic."

Census officials opted not to do a second mailing out of concern that it would lead to households' being counted twice.

The issue of the response rate is a critical one. Estimates are that each percentage point below 61 percent will add another $25 million to the cost of the census, mainly from sending census takers to the unresponding homes to get the information. Lower census-return rates also increase the possibility of error, since mailed responses tend to be more accurate.

Prewitt had already said that if the mail-response rate fell below 61 percent, "we will have a real hard time conducting the census."
The accounting office report also suggested that the Census Bureau's efforts to count and question those who failed to return their forms might be hampered by difficulties in hiring enough census-takers.

The report noted that the Census Bureau would need about 860,000 temporary workers, known as enumerators, next year. High turnover rates in these positions means that to maintain a work force that large, the Census Bureau will have to recruit nearly 3.5 million people, which is about the population of South Carolina, for jobs that do not offer benefits like insurance or child care.

The report recommended that the Census Bureau and Congress develop contingency plans to avert potential problems for the next census. Some of the specific recommendations included passing legislation to lift the ban on hiring noncitizens and federal employees, including active-duty military personnel, for work as part-time enumerators and allowing people to work in the job without losing Social Security, veterans, Medicaid and welfare benefits.

Yet, the report makes no mention of the most contentious issues that has swirled around the census: statistical sampling, the method whose opponents say is illegal and supporters contend could address the very concerns raised by the accounting office report.

Officials of the accounting office declined to comment on the report beyond calling it a draft document whose main findings might change, depending on the response from the Census Bureau.

Senior officials at the Census Bureau say their estimates of the response rate were made prior to the development of the $102 million advertising campaign developed by Young & Rubicam to get people to respond to the census forms. As a result, they say, the
form-return rate may exceed 61 percent.

<p>Census Bureau officials said they had no difficulty in hiring enough people in 1998 for the dress rehearsals of the 2000 census, indicating that if a sufficient wage is offered, the Census Bureau will not have a problem hiring temporary staff members.</p>

<p>Rep. Carolyn Maloney, D-N.Y., said she would sponsor legislation that would create a $100 million contingency fund that could be used for such emergencies as increasing salaries to attract more census workers.</p>

To offer another perspective: we have conducted quite a few focus groups via teleconference on health research topics over the past few years and have been pleased with the results. Teleconference groups have several advantages, including reduced time commitment by participants (because there is no travel involved); ability to include people from all over the country in each group without excess cost; and a stronger sense of confidentiality. We have found that people seem comfortable interacting this way, and react and respond to each other quite freely. Clearly you miss out on the non-verbal communication, but we have not found this disadvantage to outweigh the positive factors. I’d say give it a try and let us know how it goes!

AAPORNETters,

This message contains the latest word on the possibility that you might suffer from a crippling computer virus sent to you via E-mail.

Several years ago, the question arose among us whether one might contract such a virus via AAPORNET. The answer then was that this is *not* possible because viruses cannot be sent via E-mail.

And this remains true today. In recent months, however, a so-called "Y2K" virus has appeared which is spread via a macro contained in *attachments* to E-mail.

I forward below news of such a virus, one that has already spread on the Net under the name of Professor Irving Louis Horowitz, without any question an unwitting bystander in this most cruel prank. As the second of the two messages below attests, that virus has already wiped out much of at least one person's life's work stored entirely on computer.
I myself have noticed, in only the past few weeks, that my own virus protection has begun to flag *all* E-mail with attachments with macros as likely to contain viruses. As a result, I have adopted the policy--as announced to all my students--that I will no longer open any submitted course work sent to me as an attachment to E-mail. I suggest that each one of you consider adopting the same policy.

As for AAPORNET, I think the safest policy is that we all agree not to post any more attachments to our messages sent here (this was a bad idea anyway, since not all members of our list might be able to open such attachments, and because these are not automatically archived online like other messages, and hence are lost to AAPOR's history).

We need not submit this proposal to a Council vote, however, because we all would remain in any case powerless to prevent any member of AAPORNET from posting whatever she or he wishes to our list--including attachments (and I doubt that many of us would want this to be otherwise). It's also possible that any one of us might post an attachment to AAPORNET in error.

Therefore, I think that the safest policy, to prevent AAPORNET from being the innocent vehicle of considerable hardship for one or more people among our ranks, is that we each one of us resolve *not to open any attachment* posted to AAPORNET, regardless of how well you know the person who posted it. If we cannot trust E-mail from Irving Louis Horowitz, after all, whose messages might we trust?

Will viruses ever come to spread via regular E-mail (plain ol' ASCII text), so that AAPORNET itself might one day become a threat to each of our computer files? No, that's physically impossible, as we discussed
here some years ago. If you wish to know why, just ask the youngest child you can find to explain the computer science to you. I'd tell you here myself, but my own two favorite computer consultants are still asleep at the moment.

My best wishes for the new year, and for 2K--not the virus, of course, but the millennium.

-- Jim

Hi,

I just want to add a note to Jim's message. BACKUP ALL IMPORTANT FILES. Update your backups at the end of any day you make significant changes. Keep at least two, better three, generations of backups. That way if a problem damages the current file and you back it up before you realize it, you still have the next to latest version. If you do this the sad case described below won't be repeated.

I am going to go further. In recent weeks I have noticed that I sometimes get email from people I do not recognize with basically anonymous addresses (e.g., susan123@aol.com) or sometimes with the return address blanked out. I have now adopted the practice of deleting these messages unread.

A lot of nasty sorts out there.

Susan

AAPORNETERS,

Here's the latest on the Horowitz Worm/Virus attachment. Although I cannot personally attest to the wisdom of the advice given here (perhaps others on our list can), I can say that James Cassell almost always knows what he is talking about.

I myself am not willing to trust documents sent in rich text format (.rtf files), not because I think Cassell is very likely to be wrong, but because there is simply too much at stake to gamble.

You have all the information I now have, and can contribute your own opinions here, make your own decisions, and live with the consequences.

Oh, brave new world! (no, not Aldous Huxley--The Tempest, Act V)

Lara Miller and Nancy Kutner forwarded me copies of the note in question. According to Norton Antivirus 2000, the attachment, a Microsoft Word document, is infected with the W97M.Thus.A virus.

The document, which I've included below as plain text, sounds legitimate. My guess is that the author unknowingly produced the document on an infected machine. This just seems too narrowly targeted to be a deliberate attempt to spread a virus.

Best,
James

PS: documents in rich text format (.rtf files) maintain all those lovely
formatting features, but (to the best of my knowledge) can't carry viruses.
All word processors will read and write documents in this format. I suggest
using .rtf files instead of .doc files if you must send documents as
attachments.

To Our Friends, Readers, and Subscribers:

It has recently come to my attention that a "special abridged edition" of
Race, Evolution and Behavior by J. Philippe Rushton has been forwarded to
you. I can well understand the consternation of scholars with this
unsolicited pamphlet. Indeed, I enclose several rounds of correspondence
held
between Professor Rushton and myself indicating my own strongly critical
feelings about his linkage of intelligence and race. It was my hope; forlorn
as it turned out, that he would modify if not entirely re-examine his
previous line of research. Alas, such expectations have proven to be
unrealistic and did not come to fruition. The author was intent on moving
ahead with this "special abridged edition" in the firm belief in his thesis
and his felt need for an additional public airing of his views.
We are indeed publishers of the full sized, 1995 unabridged edition - a scholarly work that received more affirmative reviews and referee reports from impeccable sources than any other of our 4275 Transaction titles. Transaction provided a publishing outlet, not an endorsement for the author's views. However, we most emphatically are not even the publishers of this pamphlet, which, unlike the original work, was not subject to peer review or editorial discussion. The pamphlet makes an incorrect reference to Transaction as publisher. We want to emphasize this to be a quite distinct and different independent venture of the author. The author requested access to our Paine-Whitman advertising agency to assist him in mailing his pamphlet. We agreed, but forbid using any university or publishing identification in this mailing to distance ourselves from what is essentially a promotional effort by the author to promote his ideas. In this regard it also needs to be emphatically stated that no fiscal support whatsoever was either tendered or extended by Transaction to the author or anyone else in support of publication of this pamphlet.

In our 38-year history - 32 of them at Rutgers - we have taken great pride in being in the vanguard of African and African-American Studies. Indeed, if you review Transaction's Website on the Internet (http//www.transactionpub.com) it will be apparent just how powerful a commitment we have in these and related areas. We have also taken great care to adhere to the highest standards of university life and values. Therefore, this strange episode is one that causes me professional as well as personal pain. We have taken
measures to see that nothing like this ever happens again. That said, I offer
my sincere apologies to those of you who may have taken exception or offence
at receiving this unsolicited pamphlet. We just have to work harder and
smarter in the years ahead to merit your confidence.

Sincerely

Irving Louis Horowitz
Chairman of the Board

1. Not all of my students (and colleagues) know how to use e-mail properly
(yet) like including a real name in the 'from:' field and specifying a
"subject". So, simply ignoring all such messages seems a bit drastic --
though safe.

2. The problem with Jim Cassell's advice is that e-mail programs do not
check whether the extension of a file actually matches the format. So, you
may receive an attachment called "manuscript.rtf" which matter of fact is
an MS Word file containing some nasty macros. And chances are that your
computer is set up to open .rtf files with MS Word (Office). I advocate the
use of rtf, but only to avoid access difficulties on the recipient’s side who may have an older version or different word processing software altogether. This is by no means a safeguard against virus/worms.

3. Short of not accepting any e-mail with attachments any more (a fine rule for a list like AAPORNET, but a serious limitation of e-mail usage) consider the following advice:

A. Install a leading anti-virus product (Norton and McAfee (NAI)) are the two leaders in the field). Make sure that you install additional modules for “e-mail” and “download scan” and check on the default settings as to which type of files are scanned. Typically, you will scan “program files” only, but the list of extensions to be considered “program files” should be rather extensive. McAfee's default list includes "rtf"!

B. More importantly, keep your anti-virus software current. Given the increase in attacks, this may mean a *weekly* update. Some of it can be automated, e.g. McAfee includes a "Viruscan Scheduler".

C. Set up you mail client (Eudora, Netscape, MS Outlook, etc.) conservatively’. E.g., in Eudora, don’t use the MS viewer, don’t allow executables in html, etc. The more you integrate your mail client with the rest of your applications the higher the risk of damage.

D. As Microsoft seems to be a favorite target of virus/worm authors, not using MS applications (MS Outlook, MS Office) reduces your risk; but this is not a sufficient strategy in itself.

For those of you using or having access to McAfee Viruscan, here are some more detailed hints:

http://maxweber.hunter.cuny.edu/socio/anti-virus.htm

(some stuff is Hunter specific, but a lot is not)

And if you are using Eudora as your e-mail client, you may want to have a look at:
Bottom line:
Don’t get paranoid, but be vigilant about keeping your anti-virus software up-to-date and run your e-mail client conservatively.

Are Bush and McCain Really Neck and Neck?

By Matt Alsdorf

A recent poll found that John McCain leads George W. Bush among New Hampshire Republicans by 3 percentage points, with a 5 percent margin of error. Does this mean they are really in a dead heat? Possibly. You actually need two numbers to understand a poll. One is the margin of error—an estimate of how large a discrepancy might exist between a survey's results and the true value. (It's unlikely, for instance, that 1,000 people polled in some national survey will speak accurately for all 260 million Americans. The margin of error measures just how wrong those 1,000 people could be.) The margin of error is typically 3 to 5 percent and is almost always cited alongside the results. The other important number is the degree of confidence, which is the likelihood that the real value falls within the margin of error. Most polls use a 95 percent degree of confidence, so it’s usually omitted from news reports.
Here's an example of how the two numbers work together. This week, a Reuters/WHDH-TV poll showed McCain leading Bush 35 percent to 32 percent with a 5 percent margin of error. This means that there is a 95 percent chance (there's the degree of confidence) that between 30 and 40 percent of the population supports McCain (that's McCain's 35 percent plus or minus the margin of error), and a 95 percent chance that between 27 and 37 percent supports Bush.

So, based on this poll, how sure can we be that McCain is truly ahead of Bush? The answer is, Less than 95 percent sure. The reported margin of error relates to each candidate's individual score. But the margin of error on the spread (i.e., the difference between their scores) is much larger, since it incorporates the potential variations in both scores. As a rule of thumb, you can multiply the reported margin of error by 1.7 to get the margin of error for the spread. Since 1.7 times 5 is 8.5, the Reuters/WHDH-TV survey would need to show McCain with at least an 8.5 percent advantage over Bush for his lead to be 95 percent certain. Since his lead is only three percentage points, it's being called a dead heat. But the small lead is not meaningless; although it is less than 95 percent certain that McCain leads Bush, it is still more likely than not that he is really ahead.

(Visit the American Statistical Association's Web site for extensive information on common methods--and errors--in measuring public opinion.)

This is a good opportunity to direct your attention to the announcement of the AAPOR INNOVATORS AWARD in our latest mailing.

Unlike the AAPOR Award which recognizes a lifetime of achievement, the Innovators Award is directed toward highlighting a specific contribution to our field.

You don’t have to wait. Perhaps next year, you will enjoy messages of congratulations from your peers.

I will be sending the announcement of the award over AAPORNET. Note that your nomination should be sent to Nancy Belden (nancybelden@brspoll.com). However, either of us can answer questions.

Our committee will keep your nomination confidential, but unless you are careful, you may find yourself joining the legions of us that mistakenly broadcast over AAPORNET.

Murray Edelman
AAPOR Vice President

2000 AAPOR INNOVATORS AWARD

FOR SIGNIFICANT INNOVATION OR CONTRIBUTION TO THE STUDY OF PUBLIC OPINION

AAPOR has established the Innovator’s Award to highlight important contributions in the field of public opinion research. The award may be made for research studies and new research techniques that improve the understanding of public opinion. We hope that the award will help expand AAPOR’s role as a forum for ideas about public opinion research and lead to recognition of the value of this research FOR the development of good public
policy, governance and private enterprise.

The award is to be made to individuals or teams for work that has been made publicly available, either by virtue of publication or wide circulation of books, reports, articles or other methods for disseminating information. It is not necessary to be a member of AAPOR either to make nominations or to receive the award.

To be eligible, a contribution (or some aspect of it) must have been made public within the last five years.

Use this form, a separate letter, or email to nominate a candidate. You need not sign the nomination. Please include a statement in support of your nomination as well as a copy of the work for which the nominee is being honored. Also include supporting documentation—for example, book reviews, press releases, and news stories—anything that will make it easier to evaluate the contribution. Please feel free to nominate yourself.

Nominations must be received by February 1st in order to be considered for the Year 2000 Award.

If you have questions please contact Nancy Belden [nancybelden@brspoll.com; (202) 822-6090] or Murray Edelman [murray.edelman@vnsusa.org; (212) 947-0983] Nominations should be made by February 1, 1999 and sent to:

Nancy Belden
AAPOR Councilor at Large
c/o Belden Russonello & Stewart
1320 19th Street NW Suite 700
Washington, DC  20036

Nominee:

STATEMENT:
Princeton Survey Research Associates (PSRA) announces an opening for a full-
or part-time survey methodologist/statistician.

Responsibilities include designing telephone interview samples, monitoring
data quality, analyzing large government datasets, developing weights from
population parameters, documenting and reporting survey methods and serving as a survey methods resource for PSRA's diverse team of researchers.

Candidates must have a strong knowledge of applied sampling, sample weighting and statistical analysis.

PSRA is a leading survey research firm specializing in policy and social research with offices in Washington, DC, Princeton, NJ, and Fredericksburg, VA. This position may be filled in any of our three offices.

PSRA offers a competitive salary and benefits and a comfortable work environment. Our Washington, DC, office is located downtown close to the Metro.

Please fax resume and cover letter to 202.293.4757. Or email to Research.DC@psra.com or psra2@aol.com.

Dear Colleagues,

Thanks for your thoughtful responses to my query last week regarding published reports of the effects of time of data collection. What I've learned thus far is that there is indeed much conventional wisdom but no one knew of any published studies. As Paul Lavrakas indicated, the possible consequences of time of data collection are important for both nonresponse error which impacts overall data quality as well as for specific attitudes/behaviors. My guess is that the potential for "time of data collection" error may also vary somewhat depending on the content of the survey. We have begun to systematically look at several of these factors and have submitted an abstract for the next AAPOR meeting. Hopefully we'll have an opportunity to discuss this issue further in Portland.

Thanks again for your feedback.
Hi,

Can anyone offer a reference for this graduate student who has her defense next week?

Carolyn White  
University of Illinois  
cswhite@uiuc.edu

I am a graduate student at the  
University of Minnesota working on finishing my dissertation. I'm looking for a reference for a standard, acceptable data entry error rate (e.g., that the census might use). I want to be able to justify re-entering 5% of the data and my error rate. I was told that the census standard is 5 errors per 1000 keystrokes (.5% error rate), but I don't have a citation to back that up. Any help on this would be greatly appreciated.

Thanks very much,

Katherine
I am looking for surveys on teenagers' spending patterns. I would like to know individuals or outfits that do such studies, especially the methods used to interview teenagers.

Please reply to me only: Silberstein_A@bls.gov

RECRUITING BULLETIN

Opening Date: December 09, 1999 Bulletin Number: ASF-99-315

Closing Date: February 25, 2000

Department of Commerce

Position: Social Science Analyst/Research Psychologist/ Bureau of the Census

Survey Statistician Statistical Research Division

GS-0101/0180/1530-14,($68,570 - $89,142 per year) ADC (Survey Methodology)

Suitland, Maryland

DUTIES: The incumbent serves as the group leader (Questionnaire Design and Measurement Research group) who oversees multiple related projects managed
by
others, and who also may serve as project manager for his/her own projects
conducting research and development on data collection methods and other
methodological topics. Responsible for developing budgets, formulating work
plans, directing and carrying out research projects aimed at improving data
collection and questionnaires, including establishment surveys. Coordinates
project activities and work assignments with other group leaders and with
other
areas of the Census Bureau, and implement the research results by informing
project sponsors of its value and advising others on how to incorporate the
research results.
Promotion Potential: NONE

BASIS OF RATING: Applicants will be evaluated on the basis of the quality
and
extent of their total experience, education and accomplishments. Ranking of
candidates will measure the degree of which a candidate

Content-type: text/plain; charset=iso-8859-1
Content-Disposition: inline
Content-transfer-encoding: quoted-printable

?s background matches the
Quality Ranking
Factors for this position. TO BE CONSIDERED, APPLICANTS MUST SUBMIT A=

SEPARATE, INDIVIDUAL STATEMENT ADDRESSING EACH OF THE FOLLOWING FACTORS=
QUALITY RANKING FACTORS:
1. Demonstrated knowledge of qualitative and/or quantitative survey research methods.
2. Demonstrated experience contributing to the literature in survey methodology and/or social or behavioral sciences.
3. Demonstrated ability in technical leadership.
4. Demonstrated experience with applying questionnaire design techniques and other techniques to improve data quality and coverage obtained from censuses and/or surveys such as, household surveys, economic surveys, population and housing census, and establishment surveys.

QUALIFICATIONS REQUIRED: Social Science Analyst: A bachelor's degree from an accredited college or university with specialization in one or more of the behavioral or social sciences appropriate to the position OR four years of appropriate experience which demonstrates that applicants have acquired knowledge of one or more of the behavioral or social science equivalent to a major in the field OR a combination of experience and education which provides
applicants with the knowledge of one or more of the behavioral or social sciences equivalent to a major in the field. In addition, applicants must have one year of specialized experience equivalent to the next lower grade in the Federal service. This is experience that has equipped the applicant with the particular knowledge, skills, and abilities necessary to successfully perform the duties of the position and that is typically in or related to the work of the position to be filled.

Research Psychologist: Applicants must have a bachelor's degree from an accredited college/university with a major or equivalent in psychology. In addition, applicants must have one year of specialized experience equivalent to the next lower grade level in the Federal service. Specialized experience is experience that has equipped the applicant with the particular knowledge, skills, and ability to perform successfully the duties of the position and that is typically in or related to the work of the position to be filled.

Survey Statistician: Applicants must have a bachelor's degree OR a combination of education and experience equivalent to the completion of a bachelor's degree.
s degree. Studies must have included at least 15 semester hours of mathematics and statistics, of which at least 6 semester hours are in statistics. In addition, applicants must have one year of specialized experience equivalent to the next lower grade level in the Federal service. This is experience that equipped the applicant with the particular knowledge, skills and abilities necessary to perform successfully the duties of the position and that is typically in or related to the work of the position to be filled. Applicants MUST submit a copy of their college transcripts or a listing of college courses showing course number, title, grade, type (semester/quarter), and number or credit hours. Applicants selected for position will be required to supply original transcripts.

COMPETITIVE SERVICE (CAREER/CAREER CONDITIONAL APPOINTMENT)

AREA OF CONSIDERATION: ALL SOURCES  (To receive priority consideration, surplus, and displaced Commerce employees and displaced Federal employees must provide a
copy of their RIF notice or written notice of their expected separation, and a current performance rating, and be rated well qualified for this position. To be considered well qualified, applicants must meet the basic qualification standards and eligibility requirements satisfying all medical, physical, suitability, education, experience, selective factors, and quality ranking factors for the vacant position.)

Status applicants (current and former Federal competitive employees) must submit two applications if applying for both merit promotion procedures and competitive procedures. To verify competitive status, an SF-50 must be included in the application for merit promotion. If only one application is received and it does not include an SF-50, it will be considered under competitive procedures. An SF-50 is not required from Census Bureau employees since we are able to confirm their status. When only one application is received from a Census Bureau employee, it will be considered under the merit promotion program. For consideration under the merit promotion program, all status applicants =
must meet all eligibility and time-in-grade requirements by the closing date of the announcement.

Veterans who are preference eligibles or who have been separated from the armed forces under honorable conditions after 3 years or more of continuous active service may apply under merit promotion procedures.

Complete application package for each grade level of interest must be received by the close of business (5:00 p.m. EST) on the closing date of this announcement.

Payment of relocation expenses is NOT authorized.

HOW TO APPLY - SEE BELOW

HOW TO APPLY: You must send a resume, Optional Application for Federal Employment (OF-612), or SF-171 plus any additional required material for each grade level of the vacancy for which you wish consideration. The following information is needed to evaluate your qualifications and determine if you meet legal requirements for Federal employment. Failure to provide this information
may result in loss of consideration.

- Bulletin number, title, and lowest grade acceptable. If you do not indicate a grade level on your application, you will be considered for the lowest grade advertised.

- Full name, mailing address (including zip code) and day and evening phone numbers (with area code)

- Social security number

- Country of citizenship (this Federal job requires U.S. citizenship)

- Veterans' Preference. Applicants claiming 10-point veteran's preference MUST submit the SF-15, Application for 10-Point Veteran Preference, with the required proof (i.e., statement from the Department of Veterans Affairs) and the latest copy of the DD-214, Certificate of Release or Discharge from Active Duty. Applicants claiming 10-point preference who do not submit the required documentation will receive 5-point veteran's preference. Applicants claiming 5-point veteran's preference and applying with either a resume or the OF-612
MUST attach the DD-214 to receive preference. Applicants who submit the SF-171 and properly complete blocks 17-22 may be awarded tentative preference without the DD-214, but MUST provide verification if selected.

5 Veterans who meet the criteria to be considered under merit promotion must submit two applications if applying for both merit promotion and competitive procedures. If only one application is received it will be considered through competitive procedures.

- Highest Federal civilian grade held (if applicable)

- Highest education level achieved. Specify: name, city, state, zip code (if known); date or expected date (month/year) of completion of degree requirements; type of degree received; and graduate of foreign universities must include proof of foreign education equivalency to an accredited U.S. college/university

- Copy of college transcripts or list of college courses

- Paid and non paid work experience related to the position. For each work
experience include: Job title; Series/grade (if Federal employment); Duties and accomplishments; Employer's name and address; Supervisor's name and address; Starting and ending dates; Hours per week; Salary; and Indicate if we may contact your current supervisor/employer.

- Job-related: training courses (title and year); skills (e.g., other languages, typing speed, computer software/hardware, tools, etc.); certificates/licenses (current); and honors, awards, and special accomplishments (e.g., publications, memberships in professional societies, etc.)

- Status applicants (current and former Federal competitive employees) must submit two applications if applying for both merit promotion procedures and competitive procedures. To verify competitive status, an SF-50 must be included in the application for merit promotion. If only one application is received and it does not include an SF-50, it will be considered under competitive procedures. An SF-50 is not required from Census Bureau employees since we are able to confirm their status. When only one application is received from a
Census Bureau employee, it will be considered under the merit promotion program.

For consideration under the merit promotion program, all status applicants must meet all eligibility and time-in-grade requirements by the closing date of the announcement.

- Complete application package for each grade level of interest must be received by the close of business (5:00 pm EST) on the closing date of the announcement.

If using regular mail, send to: Bureau of the Census, Human Resources Division, Merit Assignment Office, Room 1412, FB 3, Washington, D.C. 20233. If using an overnight delivery service, send to: Bureau of the Census, Human Resources Division, 4700 Silver Hill Road, Merit Assignment Office, Room 1412, FB 3, Suitland, Maryland 20746. CAUTION - If using regular mail to send your application, do not use the overnight delivery address - it may not be delivered. For more information call the vacancy information line at 301-457-4499.

OTHER IMPORTANT INFORMATION:

- You will be required to complete a Declaration for Federal Employment=
to determine your suitability for Federal employment and to authorize a background investigation. You will also be required to sign and certify the accuracy of all the information in your application. If you make a false statement in any part of your application, you may not be hired; or you may be fired after you begin work; or you may be fined or jailed.

- If you are a male over age 18 who was born after December 31, 1959, you must have registered with the Selective Service System (or have an exemption) to be eligible for a Federal job.

- Use of any Government agency envelopes to file job applications is a violation of Federal laws and regulations. Applications submitted in Government envelopes or via Government FAX machines will not be accepted.

- Disabled applicants, disabled veterans, or any other applicants eligible for non-competitive appointment not requiring competitive status, should specify their special eligibility on the application. Individuals with a disability may
request reasonable accommodations by calling the Human Resources Division on 301-457-3274.

- Applicants appointed through this authority are subject to a probationary period. If a vacancy is for a supervisory or managerial position, the selectee may have to serve a supervisory/managerial probationary period.

THE DEPARTMENT OF COMMERCE (DOC) DOES NOT CONDONE OR TOLERATE DISCRIMINATION BASED ON RACE, COLOR, RELIGION, SEX, NATIONAL ORIGIN, AGE, PHYSICAL OR MENTAL DISABILITY, OR SEXUAL ORIENTATION.

DEPARTMENT OF COMMERCE SURPLUS OR DISPLACED EMPLOYEES REQUESTING SPECIAL SELECTION PRIORITY CONSIDERATION

If you are currently a Department of Commerce employee who has received a Reduction in Force (RIF) separation notice or a Certificate of Expected Separation you may be entitled to special priority selection under Department of Commerce's Agency Career Transition Assistance Program (CTAP). To receive this priority consideration you must:

1. Be a current Department of Commerce career or career-conditiona
I (tenure group I or II) competitive service employee who has received a RIF separation notice or a Certificate of expected Separation (CES) and, the date of the RIF separation has not passed and you are still on the rolls of Department of Commerce. You must submit a copy of the RIF separation notice or CES along with your application.

2. Be applying for a position at or below the grade level of the position from which you have been separated. The position must not have a greater promotion potential than the position from which you were separated.

3. Have a current (or last) performance rating of record of at least fully successful or equivalent. This must be submitted with your application package.

4. File your application by the vacancy announcement closing date and meet all the application criteria (e.g., submit all required documentation, etc.).

5. Be rated well-qualified for the position. To be considered well qualified, applicants must meet the basic qualification standards and eligibility requirements satisfying all medical, physical, suitability, etc.
experience, selective factors and quality ranking factors for the vacant position.

**DISPLACED EMPLOYEES REQUESTING SPECIAL SELECTION PRIORITY CONSIDERATION UNDER THE INTERAGENCY CAREER TRANSITION ASSISTANCE PROGRAM (ICTAP)**

If you are a displaced Federal employee you may be entitled to receive special priority selection under the ICTAP. To receive this priority consideration you must:

1. **Be a displaced Federal employee.** You MUST submit a copy of the appropriate documentation such as a RIF separation notice, a letter from OPM or your agency documenting your priority consideration status with your application package.

The following categories of candidates are considered displaced employees.

A. Current or former career or career-conditional (tenure group I or II) competitive service employees who:
1. Received a specific RIF separation notice; or
2. Separated because of a compensable injury, whose compensation has been terminated, and whose former agency certifies that it is unable to place; or
3. Retired with a disability and whose disability annuity has been or is being terminated; or
4. Upon receipt of a RIF separation notice retired on the effective date of the RIF and submits a Standard Form 50 that indicates "Retirement in lieu of RIF"; or
5. Retired under the discontinued service retirement option; or
6. Was separated because he/she declined a transfer of function or directed reassignment to another commuting area.

OR

B. Former Military Reserve or National Guard Technicians who are receiving a special Office of Personnel Management (OPM) disability retirement annuity under section 8337 (h) or 8456 of title 5 United States Code.

2. Be applying for a position at or below the grade level of the position from which you have been separated. The position must not have a greater pr=
motion
potential than the position from which you were separated.
3. Have a current (or last) performance rating of record of at least =
fully
successful or equivalent. This must be submitted with your application=
package.
(This requirement does not apply to candidates who are eligible due to
compensable injury or disability retirement.)
4. Occupy or be displaced from a position in the same local commuting=
area of
the position for which you are requesting priority consideration.
5. File your application by the vacancy announcement closing date and=
meet all
the application criteria (e.g., submit all required documentation, etc.=
).
6. Be rated well-qualified for the position. To be considered well q=
ualified,
applicants must meet the basic qualification standards and eligibility
requirements satisfying all medical, physical, suitability, education,
experience, selective factors and quality ranking factors for the vacan=
t
position.

Folks,

Yesterday I received the following message, which the sender suggested that I might post to AAPORNET, but which could only be done anonymously.

Because the soul inside me does not much like anonymous postings to a free and open discussion, I shall take full responsibility myself for this message. So if you share my own dislike for anonymous postings, please accept this as something that comes from me, and respond with that in mind.

How could you ever be certain, after all, that I am *not* the author?

The true author will also see what you post, and can be reached via me--either publicly or privately--if you have any questions to ask, or private messages to convey.

And I state here my own strong hope that the author will eventually come forth to join publicly in the discussion.
Hi Jim,

I just received the solicitation below -- from Harris to participate in one of their on-line polls. After responding to one several months ago out of sheer curiosity about the method, I have received similar messages on roughly a biweekly basis.

My first thought was about the representativeness of their sampling -- and the frequency of their polling -- since I get asked so frequently. But my doubts about the methodology of on-line polling aside, one thing's certain: the sheer prolificacy of the mail has forced me to treat the Harris Polls the same way I treat all other spam: by hitting <delete>!

The reason why I forward this one to you, in particular, is because I have noticed an increasing use of provocative (and, arguably, shameless) efforts by Harris to improve their response. A few months ago, there was a "personal" appeal by "Gordon Black, CEO" to respond to a medically oriented survey because Gordon, himself, apparently suffered from the condition.

Now, they are resorting to subject lines with sexual and subversive overtones in order to get the "respondent" to open the mail.
I am curious to know what your views are on this -- and if AAPORites find practices like this acceptable.

I would have posted this to the list, but I really don’t want to cause a ruckus or be a thorn in the side of Harris. Perhaps such criticism would be taboo to such titans as Harris/Black; you would know better than I would.

If you feel like this is good material for discussion on AAPORnet, please do forward it along. But, if I could ask, please do so anonymously. Many thanks.

Take care and best for the holiday.

Yours,

Subject: Do you want to know what your neighbors are doing?

Hello! Harris Poll Online is currently conducting a survey regarding recent activities and would like to include your opinions. This survey should take no more than 15 minutes. After all of the results are in, we will send you the URL for a private web site where the results of the survey will be posted… and you can discover what your neighbors are doing!
To participate in this survey, please proceed to:

http://www.harrispollonline.com/surveys/ipdec13j.htm?

When prompted, please enter the password below.

Password:

AOL users, we encourage you to minimize the AOL window and opt to use a browser such as Netscape or Internet Explorer when taking Harris Poll Online surveys. These browsers connect directly to our surveys resulting in a quicker connection and overall better survey experience.

Or, if you cannot use another browser, please use the following link:

<A HREF="http://www.harrispollonline.com/surveys/ipdec13j.htm?">Harris Poll Online Recent Activities Survey</A>

We thank you for your time and look forward to your participation.

Even though the article was useful in terms of the ideas presented and the example given, I found the actual explanation to be so garbled as to be useless in terms of understanding what the "margin of error" represents.

My impression was that the author clearly did not understand the concept of sampling error in the first place. He appears to have asked a statistician and reported the answer he got with no more comprehension afterward than before.

This is too bad, because there are a number of good books that explain sampling error in terms that even a journalist should be able to understand.

My favorite is "The Opinion Connection" by Albert Cantril (CQ Press, 1991), because it not only presents extremely clear explanations of the concepts in the context of political polls, but also has excellent discussions by knowledgeable practitioners of the issues involved and how they are reported in the press.

Dear Carolyn:

Tell your graduate student to call the people at the IPUMS project and ask them about error rates for data entry. They have investigated it a great deal since they are entering early CENSUS data.
They are at Minnesota!

They are at www.ipums.umn.edu.

Hi Adriana,

In 1996, I conducted a survey on the economic living conditions of community college students in the province of Quebec (n=3000). I did a
detailed analysis of their budget and their spending habits, and the impact of these conditions on their academic performance. I used a self-administered questionnaire (around 300 questions in English and French). I can give you more detailed information at a later time.

First of all, I see no reason at all to post this anonymously. If someone wants to criticize Harris, then he/she should do it out in the open and put his/her name to it. The only acceptable exception would be a "whistle
"blowing" case, someone inside an organization revealing dubious practices, but fearing for his/her job. What we have here is just plain cowardice -- or worse, a sneaky way trying to hurt a competitor. There should be no room for this on AAPORNET.

As to substance, I think one needs a vivid imagination to characterize this sales pitch as "sexual and subversive". ("Now, they are resorting to subject lines with sexual and subversive overtones in order to get the "respondent" to open the mail.") Maybe, they even have satanic images hidden on the questionnaire screens?

Seriously, it may *not* be a wise decision to use a bit of humor in a cover letter, as what some people find funny others may find offensive. And there may be considerable regional differences. See, e.g., the hilarious story in the NYT of Nov 7, 1999 on "combat pay" for telephone interviewers for calling people in NYC. (If you have access to Lexis-Nexis, you can get the story there for free, use "telemarketing" and "Zogby" as search terms along with the date -- or pay $2.50 to get it from the NYT's own archive.)

Several months ago, I posted some critical comments about Harris's online questionnaires and their respondent selection procedures myself (it may have been on POR rather than AAPORNET). And I (i.e., any of my online personalities) have not received another invitation to a Harris online poll in a while, but my guess is that their system still needs some fine tuning rather than that Harris engages in dark practices.

Do you know what other survey organizations (and their interviewers) are doing to get people to participate in their surveys? :-(
Jim,

i have to agree with the thrust of manfred's first paragraph, which follows. "First of all, I see no reason at all to post this anonymously. If someone wants to criticize Harris, then he/she should do it out in the open and put his/her name to it. The only acceptable exception would be a "whistle blowing" case, someone inside an organization revealing dubious
practices, but fearing for his/her job. What we have here is just plain cowardice -- or worse, a sneaky way trying to hurt a competitor. There should be no room for this on AAPORNET."

practices like this acceptable.

I would have posted this to the list, but I really don't want to cause a ruckus or be a thorn in the side of Harris. Perhaps such criticism would be taboo to such titans as Harris/Black; you would know better than I would.

If you feel like this is good material for discussion on AAPORnet, please do forward it along. But, if I could ask, please do so anonymously. Many thanks.

Take care and best for the holiday.

Yours,

Subject: Do you want to know what your neighbors are doing?

Hello! Harris Poll Online is currently conducting a survey regarding recent activities and would like to include your opinions. This survey should take no more than 15 minutes. After all of the results are in, we will send you the URL for a private web site where the results of the survey will be
posted... and you can discover what your neighbors are doing!

To participate in this survey, please proceed to:

http://www.harrispollonline.com/surveys/ipdec13j.htm?

When prompted, please enter the password below.

Password:

AOL users, we encourage you to minimize the AOL window and opt to use a browser such as Netscape or Internet Explorer when taking Harris Poll Online surveys. These browsers connect directly to our surveys resulting in a quicker connection and overall better survey experience.

Or, if you cannot use another browser, please use the following link:

Harri's Poll Online Recent Activities Survey

We thank you for your time and look forward to your participation.

You have received this invitation from the Harris Poll Online because your e-mail address was selected at random from the Harris Poll Online's registry of members. You (or someone using your e-mail address) may have become

A discussion of methods used to secure wider participation in on-line surveys might be inviting and worthwhile for AAPOR members if there were no reference to Harris/Black specifically (but only to a research firm) but the (anonymous) author identified himself or herself. Under those circumstances the author would be behaving more ethically as well.

Under those circumstances the author would be behaving more ethically as well.

While I tend dislike the concept of anonymous postings in general I think impugning the ethic of someone who does so is precipitous. It is
difficult to
discern an anonymous poster's motives and what may look like a campaign
to
tarnish an individual company may actually be a methodological concern.

Of course, your mileage may vary.

Just a reminder, the Portland AAPOR Conference will present perhaps the most comprehensive review thus far of internet polling, its pros and cons. The AAPOR Conference Committee is making a special effort to encourage papers and panels to examine internet polling issues. We expect to have multiple panels on this subject. Representatives of internet polling firms and academic researchers will be presenting. The Friday evening Plenary will also be centered on the impact of the Internet.

Please mark off May 18-21 (May 17 if you plan to attend the WAPOR conference) on your calendars. We will be providing more detailed information about panels, presentations, etc. in early February.

Folks,

Yesterday I received the following message, which the sender suggested that I might post to AAPORNET, but which could only be done anonymously.

Because the soul inside me does not much like anonymous postings to a free and open discussion, I shall take full responsibility myself for this message. So if you share my own dislike for anonymous postings, please accept this as something that comes from me, and respond with that in mind.

How could you ever be certain, after all, that I am *not* the author?
The true author will also see what you post, and can be reached via me--either publicly or privately--if you have any questions to ask, or private messages to convey.

And I state here my own strong hope that the author will eventually come forth to join publicly in the discussion.

-- Jim

Subject: FW: Do you want to know what your neighbors are doing?

Hi Jim,

I just received the solicitation below -- from Harris to participate in one of their on-line polls. After responding to one several months ago out of sheer curiosity about the method, I have received similar messages on roughly a biweekly basis.

My first thought was about the representativeness of their sampling -- and the frequency of their polling -- since I get asked so frequently. But my doubts about the methodology of on-line polling aside, one thing's certain: the sheer prolificacy of the mail has forced me to treat the Harris Polls the same way I treat all other spam: by hitting <delete>!

The reason why I forward this one to you, in particular, is because I have
noticed an increasing use of provocative (and, arguably, shameless) efforts by Harris to improve their response. A few months ago, there was a "personal" appeal by "Gordon Black, CEO" to respond to a medically oriented survey because Gordon, himself, apparently suffered from the condition. Now, they are resorting to subject lines with sexual and subversive overtones in order to get the "respondent" to open the mail.

Market Research Analyst

Edison Media Research, a small, rapidly growing market research company located in Central New Jersey is seeking candidates with one to five years experience in a market or media research environment. In this position you will be responsible for coordinating research projects from questionnaire development through data analysis and presentation.

The ideal candidate should be detail-oriented and self-motivated, with the ability to handle multiple tasks in a fast-paced environment. An interest in media, music and pop culture is a plus. Computer skills essential.

We offer excellent salary with bonus potential. Benefits package includes
401(k) with employer match and employer-paid health insurance.

Edison Media Research conducts survey research and provides strategic information to radio stations, television stations, newspapers, cable networks, record labels and other media organizations.

Please mail, fax or email resume, which must include salary requirements to:

I see your point. Actually, AAPOR is not very good at enforcing either methodological correctness or professional ethics. I will probably be ostracized for saying so!

-------

Thank you, Mike, for bringing us back to this substantive issue.

I have no knowledge of the truth of what has been described or alleged, other than my respect for the source of the information--an AAPOR member in good standing with more than the AAPOR average number of years of formal education, who works at an organization of more than average prominence in our collective activities.

No one could be happier than I would be were the allegations to turn out to be entirely false. I posted them because I have some reason to believe that they may not be entirely false, and I think AAPORNET is much better than I would be alone at getting to the bottom of all this.

My own feelings: Any business that does not take seriously the opinions and complaints of its customers is doomed to failure; any researchers who do not take serious interest in the experiences of their volunteer human subjects and survey respondents are also doomed to failure. Public opinion about all social researchers--including all survey, public opinion, and market researchers--ultimately depends on the public's perceptions of the most often experienced and best-reported or publicized cases, both good and bad.
In short, we all of us—whether we conduct research, contribute to its methodology, write academic or client reports on its findings, or report these to mass audiences—rise or fall in the eyes of the public, and therefore in our own abilities to do our best work, together, as a whole. So I’m afraid we are stuck with one another, the best and the worst among us, for good or for bad, because that is how the general public—our subject and respondent and client pool, after all—will inevitably see us.

That said, AAPOR’s mission seems to me obvious: On the one hand, we must give regular and well-publicized awards and other recognition to the best of every aspect of our collective field of interest (as we do, for example, by disseminating information about new findings, methods, theories, analyses and publications via Public Opinion Quarterly). At the same time, however, we must also identify and attempt to end or improve the worse examples of our collective work, whether these bad apples should turn up in textbooks, teaching, research practices, protection of respondents, relationships with clients, or behavior on the Internet.

So, in the case of this particular "thread in the solicitation proposal," as Mike puts it, I think we owe it to all AAPOR has stood for, for now more than a half-century, first to share whatever we collectively know about this case on AAPORNET and then—should there be some collective feeling among us that one or more bad apples are in hand—to proceed with discussions about how we might alter those practices that reflect poorly upon, or threaten possible damage to, whatever it is we all do, or care about, or wish to preserve.

SNIP

So, in the case of this particular "thread in the solicitation proposal," as Mike puts it, I think we owe it to all AAPOR has stood for, for now more than a half-century, first to share whatever we collectively know about this case on AAPORNET and then--should there be some collective feeling among us that one or more bad apples are in hand--to proceed with discussions about how we might alter those practices that reflect poorly upon, or threaten possible damage to, whatever it is we all do, or care about, or wish to preserve.

I suspect that I am not alone in the feeling somewhat uncomfortable about the "solicitation proposal" that we saw. I am not sure that it is in any particular way unethical but it certainly seems unprofessional. A lot depends on what you would see once you went to the specified website and entered your password.

This discomfort about that appeal without an ethical hook upon which to hang it upon is one of the reasons I had not commented on this
Hello,

I'm new to AAPORNET and have found the conversation regarding a questionable Harris Poll Online invitation quite intriguing, but certainly not alarming.

I hope I can inform the discussion. Some background: As you may know, we (Harris Interactive) are not surveying cross-sections of adults whom we...
speak to but once via phone. For this reason, we possess a vital interest in building a community of cooperative respondents who enjoy expressing their opinions. The *last* thing that we want to do is manipulate, exploit, or otherwise annoy our respondents. If we do so, we risk defection. And if our respondents defect en masse, we are out of business—-not a very pleasant thought. I have received more than 50 email invitations to participate in Harris Poll Online surveys this week (as I should because I or my staff review all invitations and surveys). The quality and character of these invitations varies, but not by much. The invitation in question is no better or worse than most of our invitations. That is, it has produced a response rate quite similar to our mean response rate for all surveys. It has also performed similarly in terms of number of complaints, compliments, and so forth to our other surveys. Most important, the information that we have elicited through this survey (and with this invitation) compares quite favorably to that which we have elicited through a parallel phone survey. We are not perfect, but we are learning.

Subject: The Vanishing Voter Project (fwd)
Dear Colleague,

We write to inform you about a Campaign 2000 research project that is underway at Harvard's Kennedy School of Government. We invite you to make use of the study's findings in your teaching and research. We encourage you to visit the project web site (http://www.vanishingvoter.org) and subscribe to the free weekly releases that are part of the study.

Funded by The Pew Charitable Trusts, the project includes weekly national polls (n=1000) of the American electorate that are designed to measure the public's interest and involvement in the presidential campaign. We seek to understand
the factors that encourage and discourage public engagement. We began our weekly surveys a month ago, and our findings thus far include, for instance, a belief among most Americans that the campaign is too long and has begun too early. Our surveys have also uncovered more week-to-week variation in voter engagement (paying attention to election news and talking and thinking about the campaign) than might be expected. Between now and the November election, we will closely examine the impact of the key primaries, the conventions, the general election debates, and other events on the public's campaign interest and involvement. These findings will be the basis of recommendations for structural changes in the presidential selection process.

We welcome recommendations you might have that would strengthen the study. Our only restriction on suggestions is that they fall within the general area of public interest and engagement and not, for instance, the horserace.

Our web site (http://www.vanishingvoter.org) has additional information on the study and contains results from the first five weekly surveys.

Thank you.

Thomas E. Patterson Tami Buhr

Subject: Looking for mailing/E-mail lists
Date: Thu, 16 Dec 1999 19:30:27 -0500
Message-ID: <NCBBKJCJFIDCKOFNAEMEJCCMAA.mark@bisconti.com>
I am looking for sources of up-to-date, clean, targeted mailing lists in U.S. and Canada (with E-mail addresses, if possible) of people with a likely interest in energy or electricity issues... in the following groups:

--Industrial institutes and associations
--Environmental groups
--Labor groups
--Consumer groups
--Business associations
--National and state/Provincial elected officials
--Wall St./investors
--Insurance industry executives
--Lawyers
--Think tanks and research institutions
--Media/reporters
--Libraries

I am aware of the Yellow Books/Leadership Directories for U.S.

If you have suggestions, please E-mail me directly at mark@bisconti.com.
THANK YOU. Mark Richards

Rather, you should be praised for saying so.

I don't think AAPOR (or any professional organization, for that matter) should ever attempt to enforce methodological correctness, but AAPOR would gain a lot more credibility if it showed some spine with respect to professional ethics.

The AAPOR code doesn't even prohibit conflicts of interest that would land members of recognized professions in jail, such as the scam perpetrated by Dick Morris and Penn & Schoen during the 1996 elections, conducting polling to assess the effect of DNC advertising while they were secretly getting a cut of the ad placement fees. Until AAPOR does address this kind of thing, it really can't claim any kind of authority.

From: "Thomas M. Guterbock" <tmg1p@cms.mail.virginia.edu>
To Jim and AAPORnet:

I took another look at the Harris solicitation message after Mike Traugott's message properly re-directed us to the main issue at hand.

The writer's first issue is that Harris looks pretty hungry for respondents and that leads to questions about the quality of their sampling. That's an issue that goes to survey quality but not really to ethics. Researchers on high quality surveys are often led to use either very urgent-sounding or quite informally-toned appeals in an attempt to achieve high rates of response.

The anonymous writer characterizes the Harris solicitation messages as having "sexual and subversive overtones." It really is not clear that the appeal to "find out what your neighbors are doing" necessarily appeals to either sexual or subversive motives. It probably appears more to peoples' generalized curiosity about others. It appears that Harris is promising respondents an exclusive, advance look at a summary of results. This has always been considered to be a legitimate, relatively non-biasing incentive for respondents (cf. Dillman's TDM book) and it's one of the few incentives that researchers are easily able to provide. The wording does have a "come-on" or titillating tone that puts me off. I also grant that some
potential respondents might imagine that the survey reveals sexual goings-on, or think initially that the results site would have individual identifiers on it. An academic survey center such as the one I direct would not use a solicitation with this sort of tone. But we’d abjure it more because we think it unseemly than because it is unethical.

In short, I don’t think this solicitation misleads in any clear, concrete way that would violate norms of informed consent. My main criticism of it is the faint suggestion that privacy of other respondents would not be respected in reporting results. This is an implication that Harris ought to avoid as such a suggestion could lead to serious mis-impressions in the public about how survey organizations treat confidentiality of collected data. Maybe that’s what Jim and his correspondent are so bothered by.

I note with approval that Harris includes information on where they got the individual’s e-mail address and how to stop the solicitations.

My 2 cents. . .

this whole brouhaha, and others could easily draw other inferences. even
in the unlikely event that the intention was to convey a sexual
connotation, what exactly is subversive about that? to me, it seems
obvious that the survey firm was offering respondents the survey results,
not information about the person next door, nor any other indiscrete
information.

it is my understanding that if one participates in a harris interactive on
line poll--and i assume other reputable internet polling efforts--that one
can simply opt out at any point and the solicitations will stop.

moreover, the neither originator nor her/his accomplice have offered any
reason for the anonymity other than to suggest that unknown person has
something to fear by putting their name to the posting. this smacks of a																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																																								
Is there any interest in this thread in the solicitation proposal as opposed to the etiquette of anonymous postings?

So, in the case of this particular "thread in the solicitation proposal,"
as Mike puts it, I think we owe it to all AAPOR has stood for, for now more than a half-century, first to share whatever we collectively know about this case on AAPORNET and then--should there be some collective feeling among us that one or more bad apples are in hand--to proceed with discussions about how we might alter those practices that reflect poorly upon, or threaten possible damage to, whatever it is we all do, or care about, or wish to preserve.

I suspect that I am not alone in the feeling somewhat uncomfortable about the "solicitation proposal" that we saw. I am not sure that it is in any particular way unethical but it certainly seems unprofessional. A lot depends on what you would see once you went to the specified website and entered your password.

This discomfort about that appeal without an ethical hook upon which to
Someone (Andy Beveridge?) mentioned the explanation of confidence intervals in "Slate" (Microsoft’s free online political magazine) the other day, the following pursues this thread further.
The Annenberg/CPB instructional multimedia collection contains a number of shorter "exhibits" -- including one on the statistical foundations of political polls. It starts off with a short questionnaire asking the web site visitor about their prior experience with polls, their confidence in their accuracy, and their belief about the effect of reported polls on the vote (obviously a *convenience* sample of currently over 11,000 visitors). In a nutshell: 50% have participated, 60% believe polls are usually accurate (but 40% do not), 90% believe reported polls influence the vote. Quite plausible that people suspicious of polls are more likely to visit this site than others, still .... The exhibit can be accessed at http://www.learner.org/exhibits/statistics/

I think it is rather nicely done and the explanations offered are quite good. And for each concept or term there are additional links providing more depth. Not all of those I found on target, but -- by and large -- a great effort to educate the public about an important and often insufficiently understood topic.

The exhibit is based on parts of the well-received statistics video course "Against all odds" (produced some 10 years ago, but still available). And one of the guys involved in putting this exhibit together, Robert Niles, runs his own "Statistics Every Writer Should Know" website at http://nilesonline.com/stats/

I am aware that AAPOR has its own little brochure, but the "didactic packaging" on these sites is a major advantage. So, for those AAPOR members involved in teaching, I highly recommend to take your students to the Annenberg exhibit -- and the primary season during the spring semester is the perfect time.

The exhibit is based on parts of the well-received statistics video course "Against all odds" (produced some 10 years ago, but still available). And I would offer a unsolicited plug for the videos in Against All Odds. The Textbook that they were originally designed for Introduction to the Practice of Statistic by McCabe and Moore is quite excellent. Its focus is on exploratory data analysis and data analysis more generally. It is completely computer intergrated, and is far better than most of the so-called "Social Statistics" texts that are available.
I think it is has sold over 1 million copies. The videos make the practice of statistics and data analysis real and include: the General Social Survey; the Census; the controversy around the Coleman report; comparable worth; whether smoking causes cancer. They spent a lot of money on this and it shows. Many of the half-hours, have two our three little movies within them.

While I am not familiar with the video mentioned, the McCabe & Moore textbook is the one I usually recommend to my clients who want to understand statistical significance and confidence intervals.

David S. Moore, one of the authors of that text, also has a very nice book called "Statistics - Concepts and Controversies" containing a variety of informal and very illuminating discussions of practical uses of statistics in real world situations. I believe it is now in its 4th or 5th edition. It sounds like it may consist of much of the same material as the videos.

Subject: The Vanishing Voter Project (fwd) -Reply

This is an extremely valuable project. It might be even richer if you
consider making some portion of the sample into a panel as with the
Michigan election studies.
A self-styled "nationwide opinion poll" with the above heading came to me from two different colleagues this past week. The flyer invites one to check one of two big boxes--YES or NO--and fax it back to "21st Century Fax Ltd." 1204 Third Avenue, Suite 108, in NYC. The small print informs one that "Calls to these numbers cost $2.95 per minute, a small price for greater democracy. Calls take approx 1 or 2 minutes. Your views are important. We make sure that decision makers are hearing them!" In larger type: "Your votes will be presented to the Senate, the Dept of Social
Services” etc. A call to the 800 phone number listed was answered by, what a surprise, an answering machine. There was also a 646 area code number and a website where one could view the poll results: www.pollresults.co.uk.

A memory trace from aapornet postings of some time ago screamed "scam" at me. I have a few questions for fellow-aapornetters about this:

1. Is this illegal or just unethical?

2. Is there anything to be done about it? This kind of baloney can’t be good for the reputation and credibility of public opinion polling.

3. Does anyone have any idea how successful these things are?
   The colleagues who gave me the flyer did not detect that it was a scam, which made me worry that either: a) the public is really poorly informed as to what a legitimate survey should look like; b) I need to find brighter colleagues; or c) 21st Century Fax is making a hell of a lot more money out polling than I will in my lifetime.

4. Is there a name for this kind of scam, e.g. something akin to the FRUG acronym? If the baby has not yet been named, I offer MMUGPOP: Money Making Under the Guise of Public Opinion Polling. It could be pronounced either MUGPOP with the first M silent, or M-MUGPOP as a sort of stammer.

Last week I received a similar fax that appeared very official
from an organization called "Survey Information Service" with
URGENT REQUEST in a prominent box at the top. It made the following
claim: "As an URGENT assessment of the status your organization with
RESPECT to Year 2000 Readiness on behalf of and for our Supplier and
Customers, We request you verify infomration, sign & fax back to us
within seventy two (72) hours of receipt, this SIS report:

The extremely fine print indicated that a charge of $8.43 will be applied
to cover the cost of the classification.

While this is not MR as the poll mentioned by Mary Ann, it is sure a
sleasy effort to dupe people into paying over $8 for questionable service.

A memory trace from aapornet postings of some time ago screamed "scam" at me. I have a few questions for fellow-aapornetters about this:

1. Is this illegal or just unethical?

According to a number of reports the 21st Century Fax Ltd. people are being investigated by a number of US organizations for violations of the unsolicited FAX law.

http://www.freerepublic.com/forum/a3730b35613da.htm

2. Is there anything to be done about it? This kind of baloney can't be good for the reputation and credibility of public opinion polling.

I think that the AAPOR ought to do a press release denouncing this type of survey.

3. Does anyone have any idea how successful these things are?

The colleagues who gave me the flyer did not detect that it was a scam, which made me worry that either: a) the public is really poorly informed as to what a legitimate survey
should look like; b) I need to find brighter colleagues; or
c) 21st Century Fax is making a hell of a lot more money out polling than I will in my lifetime.

a) Generally, yes.
b) Probably not.
c) Good possibility.

4. Is there a name for this kind of scam, e.g. something akin to the FRUG acronym? If the baby has not yet been named,
   I offer MMUGPOP: Money Making Under the Guise of Public Opinion Polling. It could be pronounced either MUGPOP with the first M silent, or M-MUGPOP as a sort of stammer.

I like MUGPOP!

An earlier poll by the same organization (on "Gun Control") has led to an
BBB (Better Business Bureau) alert in May 99, see:
http://www.bbb.org/alerts/gunpatrol052699.html
This alert states in part:
"The fax has led to consumer complaints made to the Federal Communications
Commission (FCC)
and the Federal Trade Commission (FTC), where regulators are studying whether the survey violates U.S. laws. FCC rules prohibit sending unsolicited commercial faxes to businesses and residences.

The agency is also investigating whether the faxes violate rules for 900 numbers, which require clear disclosure that consumers must pay for the calls."

From Mary Ann's description it appears that they fixed the two legal problems: sending unsolicited faxes (now distributing flyers) and not stating the cost of the fax-back call. As I could not find anything more recent, I assume they now operate within the limits of the law.

So, the answer to Mary Ann first question seems to be: it is legal. As to "ethics", there are plenty of "phone-in" polls around and most of them charge (though typically more like $.50). All this is *not* survey research as most of us understand it, but there is nothing that would violate HSC or IRB standards.

Second question: Can anything be done about it? I don't think so, at least not legally. Of course, AAPOR could 'censor' them which is particularly effective with respect to non-members.

Third question: Yes, brighter colleagues would be a start, but this won't help with keeping the Century Fax from making more money than a lot of us. If truly over 120,000 people responded by fax -- thus paying between $3 and $6 each -- to just the gun control survey they made about half a million there. Not bad. Unless they did get fined by the FCC, but I found no trace on the FCC web site.
I decided to poke around a little more on the Internet looking for information on 21st Century Fax Ltd. In addition to the stuff that Manfred found I found the following:

As for how effective these polls are (as a money maker) see http://www.mwt.com/may97art.html page down to "Massive UK fax Poll Returns 70,000 votes"

I was particularly fond of Gordon Ritchie's (apparently the CEO of
"One day it may be possible to conduct a similar poll via the Internet, but until most people have access to the Internet, it is not yet a viable method of collecting a large amount of unbiased data. I hope that many professionals in market research will now sit up and take note of what we have achieved."

I think we ought to take note.

AAPOR should do a press release or something after the holidays. I received the same FAX "poll" (gays adopting kids) last week. In fact, would get attention if it were a collaborative press release: This is a consumer issue--should issue a joint statement with a public interest consumer group. And, include the Human Rights Campaign (gay/lesbian/bi political group) and Nat. Gay and Lesbian Task Force. Maybe even the religious right. Both
groups are more susceptible to this type of fraud. Think of story line:
gay/lesbian groups and religious right unite to fight consumer fraud... that
ought to assure TV time. Use event to inform about various forms of
fraudulent polling. MUG-Popping back... nice.

Months ago, I sent them an E-mail about my displeasure with the last one
they Faxed on "gun control." Obviously, they pick polarizing topics to
increase their response and profits.

The part that angers me is the statement they put next to the small print
telling the cost of calling: "this is a small price to pay for democracy."

I received the gun control question. Mark is right. They choose provocative questions to encourage higher response and profits.

Since results of these "polls" are never published (I believe), isn't this really a
case of consumer fraud. Does anyone know how to inform the FCC of this for further action?

1. Is this illegal or just unethical?

According to a number of reports the 21st Century Fax Ltd. people are being investigated by a number of US organizations for violations of the unsolicited FAX law.

http://www.freerepublic.com/forum/a3730b35613da.htm

2. Is there anything to be done about it? This kind of baloney can’t be good for the reputation and credibility of public opinion polling.

I think that the AAPOR ought to do a press release denouncing this type of survey.

3. Does anyone have any idea how successful these things are?

The colleagues who gave me the flyer did not detect that it was a scam, which made me worry that either: a) the public is really poorly informed as to what a legitimate survey should look like; b) I need to find brighter colleagues; or c) 21st Century Fax is making a hell of a lot more money out polling than I will in my lifetime.

a) Generally, yes.

b) Probably not.
c) Good possibility.

4. Is there a name for this kind of scam, e.g. something akin to the FRUG acronym? If the baby has not yet been named, I offer MMUGPOP: Money Making Under the Guise of Public Opinion Polling. It could be pronounced either MUGPOP with the first M silent, or M-MUGPOP as a sort of stammer.

I like MUGPOP!

If you read all messages relating to this thread, you will see
a. an URL for the web site where these results are published plus the names
   of the politicians that have been sent the results
b. that complaints with the FCC have already been filed (as with BBB)

However, Mark said that he received the "fax poll". I wonder, Nick, Mark,
did you (or anyone else) receive the "questionnaire" as an unsolicited fax?
This would make it illegal -- at least in some states -- and would provide
grounds for legal action.
Otherwise, as said before, it's a free country and if some people do not
mind to pay $3-6 (or just don't pay attention) for registering their
opinion, so what? Is AAPOR supposed to take on CNN, ESPN, or whatever news
organization that runs the next "phone-in" poll over a 900 line? These
"polls" are a nuisance, but so are zillions of "frugs" and "sugs" and AAPOR
could issue a press release at least every week.

I received it as an unsolicited FAX "poll," at my place of work. It was not addressed to anyone. They list their website and a tel. number you can call to prevent them from sending again. I sent an E-mail. It didn't work--when I received the second FAX, I threw it out and forgot about it until it was mentioned on AAPORNET. mark

I'm searching for studies/articles/analysis that investigated where Americans get information, how they process that information and if/how it forms the basis of decisions they reach on public policy issues.

I've searched the Pew database and found some helpful information, but need more.

You can reply directly to me at david.sylvia@pmmc.com

While these are similar in nature to phone-in polls using a 900 number one of the big differences (in my humble opinion) is that most phone-in polls are presented with caveats. The fact that this organization is presenting these as "Fax Poll" results and that a number of organizations are using them and their methodology as a club to beat legitimate pollsters leads me to think that AAPOR ought to at least issue a press release/statement/public paper commenting on the methodology just as it has about push polling.

Of course, as always, your mileage may vary.

Happy holidays all!

--

Leo G. Simonetta
And they are using an open server in China at Shandong Normal University to email this to probably hundreds of thousands of people. They claim 5 million but I am dubious that any decent list of 5 million American email addresses exist.

Please help us with this survey.

It is one of the most ambitious surveys ever undertaken on the subject of GUN CONTROL IN THE US, and we apologize up front for this method of delivery, however we want to contact 5,000,000 Americans BEFORE Congress returns from its break so that the President and Members of Congress will have current information to help them in their impending work.

To have your voice heard on the issue of GUN
CONTROL IN THE US, you must be at least 18 years old and do/understand the following:

Please print this message, circle your responses, and FAX your survey to 1-900-420-2021. A charge of $9.95 for the first minute or fraction thereof, and $3.95 for each additional minute or fraction thereof will appear on your local phone bill to pay for the survey. The first 10 to 12 seconds of the call will NOT BE BILLED TO YOU, and your fax will not start until the message that plays during that 10 to 12 seconds has ended. Your billing will begin when your call connects to our fax facility.

(Circle your response)

1. Should HAND GUN possession be limited to law enforcement officers?
   Yes  No

2. The second amendment states, "A well regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed". Do you think this is being properly interpreted by our representative lawmakers?
   Yes  No
3. Do we need more laws controlling GUNS in the US?

Yes  No

If YES; these are my suggestions:

__________________________________________________

__________________________________________________

__________________________________________________

__________________________________________________

I am a citizen of the State of:___________________

THE FOLLOWING ARE TOTALLY OPTIONAL

RESPONSES

My Name is:

__________________________________________________

My e-mail address is:

__________________________________________________

(We will e-mail the results to those who choose to include their e-mail address)

YOUR OPINION IS NEEDED TO ENLIGHTEN OUR
LAWMAKERS!

SPEAK NOW, BEFORE IT'S TOO LATE!

FAX YOUR RESPONSE TO 1-900-420-2021 NOW!

Feel free to copy this message and pass it along to others who want their voices heard on the issue of HAND GUN CONTROL IN THE US.

Copyright, 1999. American Tabulation & Tracking Co-op, surveying the American public on current issues and sending the results to the President and Members of Congress of the United States who have traditional e-mail service so that they will understand the true feelings of the American People.

The paper cited below is an excellent discussion of the changes that have taken place in the RDD sample frame over the past 10 years or so. Most of us have the sense that it has gotten significantly harder to achieve acceptable response rates in RDD sampling. This paper shows how the structure and composition of the RDD sample frame has changed making achievement of formerly acceptable response rates much more difficult. Now, if we only knew what to do about it.

******
Candidates seeking a presidential nomination are already campaigning heavily, and voters are trying to determine, by viewing debates and political advertisements, whom they support. This political season, they have an alternative online.

You can register your opinions on various issues, hit a button and see which candidate's views match yours.

Curt Anderson of Ashland, Ore., who set up a candidate selector at www.selectsmart.com, said he took on the task to "cut through negative ads and the hyperbole of presidential Web sites."
Since his candidate selector went online in September, up to 30,000 individuals have visited the site each day.

Mr. Anderson, a marketing director for Darex, an industrial tools manufacturer, built his first online selector in 1996 to help clients choose industrial tools. Then, on his own, he created a selector on the Web for dog breeds that he licenses to an online pet supply company.

For the candidate selector, Mr. Anderson scoured news reports to collect candidates' positions on issues like free trade and campaign finance reform. He said he tried to keep the language of the questions neutral, and although some users have accused him of left-wing or right-wing biases, many have been satisfied.

"If I were still in the classroom," wrote a visitor to the site's message board, "I definitely would have my students access this page."

One of the prevailing topics of discussion on the site's bulletin board is whether a vote for a third-party candidate would be a wasted vote; many users have been surprised to find that they have selected third-party candidates.
The more extreme position a user states, the more likely the selector is to choose a third-party candidate.

"His test is structured so that they kick you to extremes," said Michael Cornfield, a research professor at George Washington University who studies online politics. "If you choose one of the stronger positions, it weights it three times as much."

Mr. Anderson's system does not hide its methods. The site discloses the scoring system and the methodology by which candidates are selected. Experts in political uses of the Internet say that disclosure is a critical component of candidate selectors online. They warn that if the concept catches on, it could be manipulated by campaigns and interest groups to favor specific candidates.

Kathleen deLaski, director of political and government programming for America Online, helped develop a selector for AOL called President Match. Developed with CBS News, President Match is expected to be completed in January, but a test version at www.presidentmatch.com is available to anyone.
Ms. deLaski and Professor Cornfield recommended that voters watch for several factors to identify credible selectors online: neutral wording of the questions, a listing of all the candidates, full disclosure of the group or individual behind the selector, a privacy policy and an explanation of the computation process.

With those considerations in mind, Ms. deLaski said she hoped that President Match would enhance the way voters make decisions. Selectors, she said, help a voter "to step away from your preconceived notions."

"It stacks the candidates up on your la carte issue positions," she added.

"We’re not recommending that people use this as their only tool for voting, but it might help people cut through the sound bites."

Harry Browne, who was the Libertarian Party's candidate for president in 1996 and is seeking the nomination for 2000, learned about the SelectSmart site from a steady stream of e-mail from voters who discovered his campaign through the site.
But when Mr. Browne took the test himself, he found that he came up with only an 83 percent match to his actual views. So Mr. Browne, submitted position statements to the site, as did three other candidates. It was worth his time, he said, because the site is spreading awareness of the Libertarian Party.

"These were people who were ideological strangers, who said, 'I didn't know anything about the Libertarian Party,' " Mr. Browne said. With this sort of selection method, he added, "I would think that over time, we would get a lot of new people. The Internet is very, very good for us."

Several AAPORNETters have already E-mailed me personally to express doubts
or fears about the implications of my earlier posting, Rebecca Raney's article in this morning's New York Times, "Sites That Measure Candidates' Views Against Your Own." I answer here, not only to save time, but also with the hope of moving the discussion onto AAPORNET:

First of all, I think Raney's article illustrates how a hardly complex bit of software can empower individual consumers (qua potential voters, in this particular case) by providing them with a simple and convenient means to manage information (might we dare call it knowledge?) as it enters their homes, whether via the mass media or off the Web.

I think it's also clear that we are now seeing just the beginning of what will be a rapid spread of knowledge management technologies to households, to be applied mostly via the Internet and Web. The result will be, in effect, to increase the intellectual capacity of The Consumer Brain (unless, of course, you can already trade off dozens of ordinal marginal utility curves in your own head when choosing a sport utility vehicle to purchase or the political candidate to support--me, I cannot).

In short, the crude assumptions of classical economic models of consumer choices among a variety of different commodities can now be made to be true by the very software the consumer uses to make those choices.

And--but of course--the possibilities here for chicanery and corruption are boundless (unless you care to read through countless lines of code to check to see that your new software does as advertised). But, then, I do tend to be suspicious by nature (as do several of you who have just written to me).
But isn't it fun just to happen to be alive at this particular moment in human history? I wouldn't have wanted to miss this for anything...

Sites That Measure Candidates' Views Against Your Own

By REBECCA FAIRLEY RANEY

Candidates seeking a presidential nomination are already campaigning heavily, and voters are trying to determine, by viewing debates and political advertisements, whom they support. This political season, they have an alternative online.

You can register your opinions on various issues,
hit a button and see which candidate's views match yours.

Curt Anderson of Ashland, Ore., who set up a candidate selector at www.selectsmart.com, said he took on the task to "cut through negative ads and the hyperbole of presidential Web sites."

Since his candidate selector went online in September, up to 30,000 individuals have visited the site each day.

Mr. Anderson, a marketing director for Darex, an industrial tools manufacturer, built his first online selector in 1996 to help clients choose industrial tools. Then, on his own, he created a selector on the Web for dog breeds that he licenses to an online pet supply company.

For the candidate selector, Mr. Anderson scoured news reports to collect candidates' positions on issues like free trade and campaign finance reform. He said he tried to keep the language of the questions neutral, and although some users have accused him of left-wing or right-wing biases, many have been satisfied.

"If I were still in the classroom," wrote a visitor to the site's message board, "I definitely would have my students access this
One of the prevailing topics of discussion on the site's bulletin board is whether a vote for a third-party candidate would be a wasted vote; many users have been surprised to find that they have selected third-party candidates.

The more extreme position a user states, the more likely the selector is to choose a third-party candidate.

"His test is structured so that they kick you to extremes," said Michael Cornfield, a research professor at George Washington University who studies online politics. "If you choose one of the stronger positions, it weights it three times as much."

Mr. Anderson's system does not hide its methods. The site discloses the scoring system and the methodology by which candidates are selected. Experts in political uses of the Internet say that disclosure is a critical component of candidate selectors online. They warn that if the concept catches on, it could be manipulated by campaigns and interest groups to favor specific candidates.
Kathleen deLaski, director of political and government programming for America Online, helped develop a selector for AOL called President Match. Developed with CBS News, President Match is expected to be completed in January, but a test version at www.presidentmatch.com is available to anyone.

Ms. deLaski and Professor Cornfield recommended that voters watch for several factors to identify credible selectors online: neutral wording of the questions, a listing of all the candidates, full disclosure of the group or individual behind the selector, a privacy policy and an explanation of the computation process.

With those considerations in mind, Ms. deLaski said she hoped that President Match would enhance the way voters make decisions. Selectors, she said, help a voter "to step away from your preconceived notions."

"It stacks the candidates up on your à la carte issue positions," she added.

"We're not recommending that people use this as their only tool for voting, but it might help people cut through the sound bites."

Only a Luddite could disagree with your eventual conclusion.

However, when I was a boy, I regularly jumped out of rather large airplanes. Sometimes, when the door to the plane was opened, the sound and fury of the world outside in combination with the spector of what was possible filled me with dread. Thinking about having these kinds of tools in the hands of people who are trying to market things like political ideas and candidates makes me feel much the same way. On the other hand, nothing really bad ever happened when I jumped. Happy holidays everyone.

How to measure time?

Wouldn’t the National Bureau of Standards be able to answer this question?
If they don't know, we're all in deep, deep trouble. Or, any of the science magazines (Scientific American, Science, etc.) Alternatively, Peter Pan might know since he lives in Never Land where time sort of stands still. (Sorry, I couldn't resist that)

Hi!

I would like to start a discussion thread on the matter of Census 2000 approach to collecting race/ethnicity data. As I understand it the decision has been made to allow respondents to check as many race/ethnicity categories as they feel are appropriate. The decision on how to report population counts by race/ethnicity is still under discussion. Does anyone know what the issues or tentative decisions are vis a vis data base and
table generation?

Best, -Vicky

Dear All:

Below are some Q and A’s from the Census WEB Site. www.census.gov

According to Ken Prewitt, at the American Sociological Association Meeting, all iterations of race/Hispanic status will be produced for the reapportionment files (PL94-174), which include counts to the block. There will be two sets of such files: 1) One with raw counts; 2) One with counts using the coverage and enumeration improvement program. The second count will be marked official.

In one tract in Sacramento, apparently, almost 30% gave a two race answer. I think this will be also true in CA, NY, FLA, TX, other parts of the West and industrial areas. The SC test had no such problems.

There is no definite answer about the tabulations in the Summary Files to follow: these are the successors to STF1, STF3, STF2 and STF4. What constitutes any given race/Hispanic status is not yet firmed up. Furthermore, the new classification will make it very difficult to "bridge back" to older censuses.

Personally, I think the end of the one-drop rule is long overdue, but this will cause serious problems for many of the uses of Census data.
G. Will people of mixed racial or ethnic heritage be able to identify themselves on the form?

Yes. In October 1997 the Office of Management and Budget (OMB) issued revised federal standards for collecting and presenting data on race and ethnicity. Among other changes, the standards allow respondents when answering the race question option to "mark or select one or more races." The OMB made this modification after considering recommendations from its Interagency Committee for the Review of Racial and Ethnic Standards, information obtained through public hearings and other sources of public opinion, and test results from the Census Bureau and other federal agencies.

H. If respondents are allowed to mark more than one racial category, how will that response and reporting of race?

In the 1996 Census Survey, the Census Bureau tested revisions to the questionnaire that would
allow multiple responses to the race question. There was no evidence that any of these experimental treatments had a negative effect on the final mail response rates. Also, we do not expect the instruction "mark one or more" to significantly affect reporting of race, because fewer than two percent of respondents in recent tests used this option.

I. How do I Answer the question on Race?

Each respondent decides his or her racial identity. For the first time ever, people with mixed racial heritage may select more than one racial category. The groups shown in the census race question can be collapsed into the minimum race categories needed by the federal government: "White," "Black or African American," "American Indian and Alaska Native," "Asian," and "Native Hawaiian and Other Pacific Islander." People who mark the American Indian or Alaska Native category are asked to provide the name of their principal or enrolled tribe. People who select the "Other Asian," "Other Pacific Islander," or "Some other race" are asked to write-in their specific race.

J. How Should Hispanics Answer the Race question?

People of Hispanic origin may be of any race and should answer the
question on race by marking
> one or more race categories
> shown on the questionnaire, including White, Black or African American, American Indian and
> Alaska Native, Asian, Native
> Hawaiian and Other Pacific Islander, and Some Other Race. Hispanics should indicate their
> origin in the Hispanic origin
> question, not in the race question because in federal statistical systems ethnic origin is
> considered to be a separate concept from race.
>
> K. Does Everyone Need to Answer the Question on Hispanic Origin?
>
> Yes, the Hispanic origin question must be answered by EVERYONE. Those who are not of
> Hispanic origin are asked to mark the box "NO, not Spanish/Hispanic/Latino." People who are
> of Hispanic origin are asked to indicate the specific group they belong to: Cuban, Mexican,
> Puerto Rican, or other groups, such as Spanish, Honduran, or Venezuelan.

I am looking for the results of public polls conducted in the states where the early primaries are to be held (New Hampshire, South Carolina, Arizona, Michigan). The public sites I've been too all have national survey data.

Thank you for your suggestions?
At 04:37 PM 12/28/99 -0500, DION HOEY wrote:

Here a few state poll results:

(SC, just out)

http://www.politics.com/polls/polls_frame.htm (contain NH poll conducted Dec 17-21, scroll to bottom)

The Polling Report maintains a more comprehensive list. While the national polls are freely available, the state polls are available for subscribers only. Subscriptions rate are not available on the web site, but you can request a free sample of the printed version:

Other than that, I recommend using a search engine. My current favorite is Google:
http://www.google.com/

Also, if you have access to Lexis-Nexis search their newspaper data base. Most polls leave some trace in the newspapers, but even if papers have websites, you don't find a lot of stuff via web search engines. Hope this helps, MK.

Manfred Kuechler, Sociology Department at Hunter College (CUNY)

A few more data (found via Lexis-Nexis):

Michigan (Detroit News, Dec 19)
> In the December Michigan poll, Bush had a 50-25 percentage lead over
> McCain. In the November poll Bush's lead was 72-7. Other
> GOP contenders remain in single digits.

And McCain is ahead of Bush in NH (39:30, N=600) -- from the
www.politics.com website (polls provided by the PollingReport). But
according to the Boston Globe poll (released Dec 19) the lead is just
37:33, check:
http://www.newhampshireprimary.com/search_detail.html?id=5211

And a final hint (especially if you don't have access to Lexis-Nexis; if
you are in the academe, chances are good that you do have access -- though
you may not know it -- since about 50 percent of all colleges in the US
have a subscription to "Lexis-Nexis Academic Universe"; ask one of your
smarter librarians about it):
You can use a "news tracker" to automatically track news stories on state
polls. One such service is provided for free by Excite:
http://nt.excite.com/
You can then visit your "personal web page" at Excite at your leisure and
retrieve the news stories (mostly wires) on your topic.

So, there is plenty of information out there, you just need to grab it --
or have it grabbed for you. MK.

In 1980 the Census Bureau used suppression to protect the identity of minorities as the geographic levels got smaller.

In 1990 the Census Bureau used a reallocation scheme where information for a randomly chosen person of similar characteristics were substituted to protect the identity of, say the one black in a given block.

I understand that Census 2000 will also use a reallocation scheme.
Will the reallocation scheme consider multiple racial categories or only single racial categories? That is, if a person of Black & Pacific Islander dissent is to be substituted, will blacks be the population for reallocation for one of the tables produced and Pacific Islanders be the population for the other table, or will the population of persons responding Black and Pacific Islander be the population for reallocation?

If the incidence of people responding in multiple racial categories varies regionally, and reallocation is limited to the population of multiple-race respondents, doesn't this significantly complicate the reallocation process?

I realize the Census Bureau isn't going to publish the exact algorithm for reallocation, but does anyone have citations of articles discussing the process and problems or reallocation, particularly given the multiple-race categories issues?

I suppose the problem is more general -- in that similar issues arise with handling missing data. For instance, 30%+ of the block groups in Champaign-Urbana Illinois in 1990 had allocations on the questions contributing to the designation "income below poverty". (Source: American Fact-Finder) Surely this level of allocation was due more to missing data, than to privacy protection. And surely race was one of the variables used in hot-decking the missing values. In Census 2000, how will missing data be estimated?

Anyone interested in this issue ought to read "Draft Provisional
Guidance On the Implementation Of the 1997 Standards For The Collection of Federal Data on Race and Ethnicity". It is a pretty in depth discussion of the technical issues involved in changing the data collection and tabulation protocols. This document used to be available on the web through the Whitehouse website, but has subsequently disappeared. If you want a copy I suggest you call Katherine Wallman at OMB. Her number is (202) 395-3093.

 According to Ken Prewitt, at the American Sociological Association meeting,
all iterations of race/Hispanic status will be produced for the reapportionment
files (PL94-174), which include counts to the block. There will be two sets of
such files: 1) One with raw counts; 2) One with counts using the coverage and
enumeration improvement program. The second count will be marked official.
In one tract in Sacramento, apparently, almost 30% gave a two race answer. I think this
will be also true in CA, NY, FLA, TX, other parts of the West and industrial
areas. The SC test had no such problems.

There is no definite answer about the tabulations in the Summary Files to follow: these are the successors to STF1, STF3, STF2 and STF4. What constitutes any given race/Hispanic status is not yet firmed up. Furthermore, the new classification will make it very difficult to "bridge back" to older

The Whitehouse site has gone through some restructuring, and so has the OMB
subsite -- still under some reconstruction. So, probably nothing sinister
about the disappearance. However, the document is still available on the
Web via the "Federal Register" web site at

http://www.access.gpo.gov/su_docs/aces/aces140.html

Search for "Notices" issued "7/9/97" dealing with "statistical policy" and
you can retrieve the document quickly (choice of ASCII text and PDF, PDF
file is about 1.2 MB or 74 pages).

Note that this a draft documenting an intermediate point in the discussion.
The final policy plus some history can be found at:

The actual definitions are towards the end of this rather lengthy web page
(some 15 pages depending on printer/browser setup).
