From: Shapard Wolf <shap.wolf@ASU.EDU>
Subject: September 2001 archive - one VERY BIG message

This is the USC listproc archive of aapornet messages for this entire month. It is one big message, just the way the USC archive stored it. You can search within this month with your browser's search function.

Turning this into individual messages that Listserv can index and sort means a lot of reformatting. We will do this as time permits. Meanwhile, the search function works, so we have as much functionality as before. New messages are of course automatically formatted correctly--See August & September 2002.

Some of the early months have been completed. Take a look at them for an idea of how AAPORNET got started. (Thanks, Jim!)

This month saw a slew of messages with large attachments. Two are excerpted as separate messages, to see if the attachments are readable. If not, we'll delete them.

X-Mailer: Internet Mail Service (5.5.2653.19)
Content-Type: text/plain;
charset="iso-8859-1"

Can anyone please point me to existing literature or unpublished experience on whether there are any gender effects in mail survey response rates from the general public depending on whether the signature on the cover letter is a female or a male?

Thanks, PJL

Good question. I know of no studies. Mail Survey Company uses female. I think most of the big mail panels use female. You have to consider potential interaction effects with gender of the recipient, which for consumer surveys -- traditionally anyhow -- is more likely to be female. Another interaction would be title, if any is used. It would be interesting to know what large volume consumer mail survey operations like Picker (healthcare), Bruzzone (advertising) or JD Power (automotive) use.

Mark Zwelling wrote: Direct-mail advertisers would have this data.

Actually, I assume the effect of the signature's apparent gender would vary

depending on whether it is a direct mail solicitation or a mail survey.
Mail
surveys are much more efficient when there is a known relationship between
the signer (regardless of gender) and the recipient. For example, surveys
of
magazine subscribers routinely get 50% response rates to mail surveys with a
letter signed by the editor. So, what you probably really want is a
narrowly
defined test--unknown survey research company (I'm thinking it probably
doesn't matter if it's Gallup) and unknown signer on a mail survey (not a
solicitation to buy something). JAS

I think we all know that personal names can connote not only gender, but also national origin, ethnicity, race, religion, and even social status and region of the country (where do you suppose that most of the McCoys and Clampetts live, for example?).

What's even worse, respondents might infer any or all of these things about a name *incorrectly*, so that we would not have any obvious way to measure the stimulus to their responses. Even using androgynous names like "Pat Smith" would not do any good if half of the respondents take this to be male and the other half assume it is female--how are we to know, one from the other?

I myself see nothing but heartbreak for anyone intending to head down this particular methodological path.....

I know this is not the same thing, but a paper by Dommeyer& Ruggiero
(published in Marketing Bulletin, 1996)describes a study in California that
tested the effect of including a photograph of a physically attractive
researcher (in this case a woman) on a mail survey covering letter. The
photograph increased the response rate from 19 percent to 40 percent.

To Jim and others,

At least one response received to my original posting suggests that some survey researcher may be using "bogus" names as signers of cover letters in their mail surveys.

In the past I have expressed my serious concern to AAPORnet about the ethics of allowing interviewers to use bogus names when they are speaking to respondents. I extend this concern to what I consider the unethical use of a bogus name (e.g., a "gender-neutral" name of a fictitious person) in mail survey correspondence. That to me is a path best avoided, and I liken it to the well known phrasing: "oh what twisted webs we weave, when first we practice to deceive."

In terms of the substantive responses that I receive to my original query, I will summarize those in a posting back to AAPORnet once they run their course. PJL

Subject: Re: gender effects in signature of cover letters - Leora Lawton

I think we all know that personal names can connote not only gender, but also national origin, ethnicity, race, religion, and even social status and region of the country (where do you suppose that most of the McCoys and Clampetts live, for example?).

What's even worse, respondents might infer any or all of these things about a name *incorrectly*, so that we would not have any obvious way to measure the stimulus to their responses. Even using androgynous names like "Pat Smith" would not do any good if half of the respondents take this to be male and the other half assume it is female--how are we to know, one from the other?

I myself see nothing but heartbreak for anyone intending to head down this particular methodological path.....

I know this isn't the topic of the current discussion but the following statement caught my eye:

"surveys of magazine subscribers routinely get 50% response rates to mail surveys with a letter signed by the editor"

Have others experienced a similar response rate which mail surveys among magazine subscribers? This seems unusually high to me.

I am enjoying this thread. At the risk of widening it further, let me ask: What do we know in general about the power and influence of the letter signer and the subsequent effect on response rate, completion rate, and honesty? Does the celebrity of the signer have an effect?

We have some informal experience with using Defense Department civilians versus flag rank military members as cover letter signers for surveys of military members and spouses. It might be fun to see if the gender of the admiral, general, or undersecretary has any affect. I can try to pull that together if there's interest.

A couple of observations.

I think its useful to separate factors likely to influence mail survey response rates into larger and smaller influences that have been found consistently effective across populations. The largest influences in this regard are number of contacts and the sending of token financial incentives in advance. Smaller effects have consistently been obtained from such things as special contacts (higher priced mail), switching modes in a followup (e.g. from mail to telephone), respondent-friendly questionnaire design, and personalization (many, but not all situations), and inclusion of stamped (vs. business reply) envelope.

When it comes to gender or rank, it seems to me that we are probably dealing with a smaller variable than any of the above. If one is using most of the above variables to increase response and I doubt that either gender or rank will have any effect across survey populations . However, I wouldn't be surprised if isolated studies will show an occasional effect if say only one mailing is used and the overall response rate is low. The mechanism through which that effect might be realized is if there is something about the name or rank that makes the mailing and questionnaire more salient to the particular population so that people will open and read the request.

If anyone wants to pursue an experiment I would encourage you to administer it using large sample sizes, on a population with known characteristics on rank and gender, so that you can learn whether there are nonresponse error effects apart from response rate effects.

I'm saddened to forward the following from Helen Kaufmann. Dr. Klapper is a former AAPOR President.

Obituary for Hope Klapper - 9/5/01

KLAPPER, Hope Lunin. Very much loved and greatly respected by friends, colleagues and family. A truly outstanding person and professional. Her insightful thoughts and perceptive comments, her warmth and sense of humor will be greatly missed. A Ph.D. in sociology from Columbia University. Formerly, a professor in the Sociology Department of New York University, teaching mass communications and related subjects. The first instructor selected in a trial of teaching regular college classes via TV. The first woman to be elected President of the American Association for Public Opinion Research. Widow of Joseph T. Klapper, Head of Social Research at CBS. Deeply mourned by family members and friends. Services Friday, Sept.7 at 11:30 AM at the Riverside in NYC at Amsterdam Ave. at 76th St..

Actually, with affinity groups, such as employees of the same organization, rank of the sender can be extremely salient, especially if he or she is the boss.

Dear colleagues,

Is it fact or urban legend that one cannot copyright individual items?
The arguments against include:
1) Most items have been used by lots of people over the years and are
essentially in the public domain
2) At worst, all one has to do is change a few words to make someone
else's item different.

(I remember going through this same process with test items, but have heard
different answers from different people)

The arguments for include:

- 1) Any original written work can be protected by copyright
- 2) No one can use your intellectual property without permission

Both sides could be right here since they are seemingly arguing different
things. Anyone have any case law on this?

A practical and scientific (rather legal) argument against: comparability.

Scales such as clinical diagnostic tools, psychometric measures of
personality constructs, etc. are often copyrighted, but I've never
heard this extended to single items.

Dear colleagues,

Is it fact or urban legend that one cannot copyright individual items?

The arguments against include:

- 1) Most items have been used by lots of people over the years and are essentially in the public domain
- 2) At worst, all one has to do is change a few words to make someone else's item different.

(I remember going through this same process with test items, but have heard different answers from different people)

The arguments for include:

- 1) Any original written work can be protected by copyright
- 2) No one can use your intellectual property without permission

Both sides could be right here since they are seemingly arguing different things. Anyone have any case law on this?

Jim Caplan

We conducted a face to face survey with residents in a low income neighborhood. After reading the introduction to the survey, our interviewers read the following statement "Do you consent to taking this survey" If they said yes, we continued. If they said no, we thanked them for their time.

We have conducted dozens of internet surveys, mostly for membership organizations. I am interested in the broader application of internet surveys. For example:

- how do response rates compare to mail, telephone and fax surveys?
- how does item nonresponse differ with internet surveys?
- how do response distributions differ for specific questions?
- are there specific topics/types of surveys for which internet surveys are better?/worse?
- are there specific types of populations for which internet surveys perform better?/worse?
- have there been precise measurement of impacts of sampling frame bias introduced by internet surveys?
- which software programs are most popular?
- etc.

While I certainly welcome reactions based on personal experience, can someone offer good literature references that have examined these issues and other internet surveying issues? Thanks

A good place to look is the Web Survey Methodology Web Page at
www.websm.org. There, you will find hundreds of references to articles on
Web Surveys. Furthermore, you can search the site's references
alphabetically, chronologically, or subject. You can even download many
papers, presentations, or abstracts that discuss the issues about which you
were inquiring.

Sincerely yours,

Mark J. Lamias

Hope the subject got you interested!! We are looking of a physical intimacy scale to be used with 14-22 year olds that has been well documented & known to be reliable. This will be administered by audio-CASI as part of a larger computerized battery. We are currently looking at work from DeLamater & MacCorquodale, but would like to see some other options.

Anything you know of? Thanks

We would like to collect close-ended data on occupations in upcoming research. Does anyone have a good (inclusive but brief) list of close-ended occupations that we could use? Our current best option is to use the categories developed by the Census from open ended responses, but I wonder if something better might exist. Thanks in advance for your help!

If you find it, I wld love to see it. I, too, use the census code and it is unwieldy.

Subject: Re: list of occupations

The 1980 detailed census occupational codes can be found at the back of the General Social Survey Codebook. There are something under 500 of them, making it a manageable yet reasonably comprehensive list for most instances.

We would like to collect close-ended data on occupations in upcoming research. Does anyone have a good (inclusive but brief) list of close-ended occupations that we could use? Our current best option is to use the categories developed by the Census from open ended responses, but I wonder if something better might exist. Thanks in advance for your help!

The 9th District's other player
Emily's List may hold a key card in US House race
http://www.boston.com/dailyglobe2/249/metro/The_9th_District_s_other_player-.shtml
Mastery of the Old Boys' ways is fanning the hopes of state Senator Cheryl A. Jacques of Needham, for whom Emily's List has funded one of the hardest hitting and most disputed ads of the 9th Congressional District campaign.

'They've become a relatively sophisticated, inside-the-Beltway player,' said Matt Keller, legislative director of campaign watchdog Common Cause. 'They've become more savvy. They're better at understanding the rules, and playing the game by those rules, vague as they may be.' Don't feed state Senator Stephen Lynch of South Boston any of those homilies about women softening political dialogue: Emily's List funded a telephone poll in which voters were told he was a tax cheat and asked if they were aware he had no children - odd, since his daughter, Victoria, is 2 years old.

Hmm,

The list below is about what we use in our surveys for marketing research:

Which one of the following best describes your primary job function?

Accounting/finance/legal
Business management/operations
Consulting
Creative/editorial
Customer service
Education
Engineering
IS/IT/networking
Marketing/public relations
Medical/pharmaceutical
Personnel/human resources
Product management
Research & development
Sales
Technical support
Skilled Labor/Construction
Retired
Other

This list gets modified for our clients based on their target populations, but it works pretty well.

ON PHOTOGRAPHY'S EFFECT ON PUBLIC OPINION

I am sitting in my usual easy chair, early this morning, just in from lifting the morning's newspapers from the drive, and beginning to look at the front page of the New York Times.

My daughter Ann, age 6 since early April, and the only other early riser in our family, slips in beneath the newsprint to assume her cuddle position against my right side. Now with her first day of first grade a night's sleep behind her, she cannot help but notice the three-column,

full-color photograph of three young schoolgirls and their parents at the very top of the Times' front page.

Ann cannot, of course, read the caption: "Protestants Attack Catholic Schoolgirls in Belfast--Roman Catholic girls and their parents running for cover after a bomb exploded as they headed to school. The school is a few hundred yards from a 'peace line,' a street separating Protestant and Catholic homes. Page A12."

"Why do these kids look so awful?" Ann asks immediately, placing a hand on the bottom of the photo.

"I'm afraid I can't tell you, My Ann, because I don't understand it myself."

"You've never said this before," she says suspiciously. "I think you're teasing me."

"No, Ann, it's just that almost all things are pretty easy to explain. This one just happens to be one of those very rare things that I cannot explain to you at all--because I simply do not understand it."

"And don't expect to find it explained on page A12," I think to myself.

"Are these girls crying?" Ann persists.

"Well, it does look like the girl in the front is crying," I reply, "which is probably why her mother is hugging her so tightly while they walk."

"Why is she crying?"

"That I do know, and I'm very sad to have to tell you that it's because some very, very mean people tried to hurt her and her sisters."

"Why do they want to hurt little kids?"

"That's the biggest thing about this that I simply don't understand, I'm afraid. I'm not sure I really understand why anyone would ever want to hurt anyone else. Do you?"

"Who are the mean people? What are they like--besides mean?"

"All I can really tell you is that they have lived--for a very long time--in the same city as these kids, and their families look and dress exactly like the family you see in the picture."

"I don't believe that," Ann blurts out quickly, her voice almost immediately trailing off into silence.

"I can't believe it either, Annie, which is why I can't explain this to you. Have you ever tried to explain something that you can't even believe?"

This gives Ann considerable pause. Eventually she says:

"I don't think I could explain anything I didn't believe, except for

make-believe stories, with animals who can talk--they're easy to understand."

"You've just explained it for me, Annie, My Love. The girls in the picture are just part of some make-believe story, along with lots of animals who can talk--lions and tigers and bears, oh my!

"Do the mean people live near us?"

"No, no, as far away as possible--not only on the other side of our country, but then also on the other side of the Atlantic Ocean, which is almost as wide as the Pacific Ocean which we see from our upstairs windows. They'd never dare to come here--because they're cowardly--and they couldn't find us if they did.

"Okay, Daddy," Ann says, sliding out of my lap and heading off to wake her sister. The real day is about to begin.

-- Jim

The census occupational codes have several advantages. The system can be made less "unwieldy" by having interviewers assign a tentative code and writing it beside the open-ended response during the interview. This makes it necessary for every interviewer to be familiar with code category content. Costs a little more for training, but worth it, especially if the codes are used for several studies and/or the survey by its nature limits the range of occupations that will be found.

The problem with any lists I have come up with, including the Census list is that most respondents cannot correctly self-classify their jobs. The only really good collection of occupation information has been through a two or three-step open-ended occupation series.

I am interested in any close-ended occupation question that has worked relatively well for anyone out there.

If you find it, I wld love to see it. I, too, use the census code and it is unwieldy.

Subject: list of occupations

We would like to collect close-ended data on occupations in upcoming research. Does anyone have a good (inclusive but brief) list of

close-ended occupations that we could use? Our current best option is to use the categories developed by the Census from open ended responses, but I wonder if something better might exist. Thanks in advance for your help!

General Social Survey
Student Paper Competition

The National Opinion Research Center (NORC) at the University of Chicago announces the latest annual General Social Survey (GSS) Student Paper Competition. To be eligible papers must: 1) be based on data from the 1972-2000 GSSs or from the GSS's cross-national component, the International Social Survey Program (any year or combination of years may be used), 2) represent original and unpublished work, and 3) be written by a student or students at an accredited college or university. Both undergraduates and graduate

students may enter and college graduates are eligible for one year after receiving their degree. Recent college graduates who completed an appropriate undergraduate or senior honors thesis are encouraged to consider submitting such research. Professors are urged to inform their students of this opportunity.

The papers will be judged on the basis of their: a) contribution to expanding understanding of contemporary American society, b) development and testing of social science models and theories, c) statistical and methodological sophistication, and d) clarity of writing and organization. Papers should be less than 40 pages in length (including tables, references, appendices, etc.) and should be double spaced.

Paper will be judged by the principal investigators of the GSS (James A. Davis and Tom W. Smith) with assistance from a group of leading scholars. Separate prizes will be awarded to the best undergraduate and best graduate-level entries. Entrants should indicate in which group they are competing. Winners will receive a cash prize of \$500, a commemorative plaque, and SPSS Base, the main statistical analysis package of SPSS. SPSS Base is donated by SPSS, Inc. of Chicago, Illinois. Honorable mentions may also be awarded by the judges.

Two copies of each paper must be received by February 15, 2002. The winner will be announced in late April, 2002. Send entries to:

Tom W. Smith
General Social Survey
National Opinion Research Center
1155 East 60th St.
Chicago, Il 60637
